# U.S. Department of Commerce Elliot L. Richardson, Secretary

BUREAU OF THE CENSUS
Robert L. Hagan, Acting Director

Shirley Kallek, Associate Director for Economic Fields

INDUSTRY DIVISION Milton Eisen, Chief

**ACKNOWLEDGMENT**—This report was prepared under the direction of Milton Eisen, Chief of the Industry Division. James S. Werking, Assistant Division Chief for Current Programs provided overall guidance for this report.

Within the Industry Division, the preparation of this report as well as the monthly reports was performed under the supervision of William Menth, Chief, Shipments, Inventories, and Orders Branch (beginning, February 1976) and Dale W. Gordon (from 1971 through January 1976), assisted by Jesse Havard and Kathleen Swindell. Other contributing industry analysts include Steve Andrews, Ronald Danna, Ernestine Garcia, Kevin Goldbarth, Robert Harder, Henry Haurand, Paul Lewis, James Monahan, Mattie Norwood, Pamela Powell, Ruth Renwick, Steven Rudolph, Bruce Schock, and Tor Tosteson. The involvement of Audrey Brooks, David Cooper, Grace Daly, Deborah Dove, Norman Dyson, Rose Fleming, Ann Johnson and Elizabeth Witcher is also appreciated, as is that of John Overby, who coordinated the various phases of the publication process.

Henrich Mantel, under the direction of Donald Clark, Assistant Chief for Research and Methodology, developed the mathematical techniques utilized in this project.

The electronic computer programs were developed under the direction of Howard Hamilton, Assistant Chief for Operations. Sherrie Adams, Al Bolin, Clarence Gillas, Al Ginsburg, Long Pham, and Jack Wasil developed the computer editing and tabulation programs under the direction of Jerry Bell.

Finally, a special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

#### I. INTRODUCTION

The monthly data in the Current Industrial Reports Series M3, "Manufacturers" Shipments, Inventories, and Orders," have been revised to reflect (1) benchmarking of the shipments and inventory data to the most recent levels available from the 1972 Census of Manufactures and the 1973 Annual Survey of Manufactures; (2) adjustment of the levels for selected unfilled orders series; (3) recalculation of the new orders estimates; (4) conversion from the 1967 Standard Industrial Classification (SIC) to the 1972 SIC; and (5) updating of seasonal adjustment factors. The next monthly report issued in the M3 series will be consistent with the revised data shown in this publication.

The revisions in this report relating to shipments and inventories, SIC changes. and updating of the seasonal factors follow the methodology used in previous rebenchmarks and are discussed in detail in subsequent sections of this report. In total, the shipments and inventory data are revised upward for 1972 and subsequent years. The increases for total manufacturers' shipments are \$11.8 billion or 1.6 percent for 1972; \$17.7 billion or 2.1 percent for 1973; \$33.4 billion or 3.4 percent for 1974; and \$54.2 billion or 5.5 percent for 1975. As of the end of each year, the total manufacturers' inventories are revised upward as follows: \$.6 billion or .5 percent for 1972; \$4.1 billion or 3.4 percent for 1973; \$8.4 billion or 5.6 percent for 1974; and \$9.6 billion or 6.6 percent for 1975.

However, procedures for obtaining revised data for selected unfilled orders series differ from those used in earlier periodic benchmark reports. Instead of making adjustments to unfilled orders that were dependent upon shipments/unfilled orders relationships, new levels of unfilled orders were computed as of December 1969 and 1973 using essentially the procedures followed in setting the original levels for 1962. The intervening monthly figures were estimated, preserving the original month-to-month movement to the maximum extent possible. (This is discussed in greater de-

tail in section III.B.5.b.) This change in methodology was made after a detailed review of the data indicated that there was a downward bias in the published levels. The revised series presented in this report adjust for this understatement but are subject to limitations due to the lack of benchmark information. The relative month-to-month movements, however, are not seriously impacted. This is discussed in section III.B.5.

The unfilled orders levels have been revised upward by \$44.5 billion or 38.3 percent as of the end of 1973; \$52.8 billion or 38.8 percent as of the end of 1974; and \$50.5 billion or 42.2 percent as of the end of 1975. Chart A-1 shows the original and revised data for total unfilled orders, while the comparison tables show the revisions in total and for the industry groups involved.<sup>1</sup>

While the revision of the overall unfilled orders level is large, the difference between the revised and published levels represents the cumulative effect of the understatement. On a monthly basis, the average understatement was 0.3 percent, thus minimizing the impact on the month-to-month changes. For durable goods, this average was 0.3 percent. For the later period (1970-1975) the average understatement was less, i.e., 0.2 percent for total manufacturing and 0.2 percent for the durable goods industries.

The new orders series also have been revised, as the data for new orders are derived by adding the change in unfilled orders between the current and previous month to the current month's estimate. The revised data summarized in the comparison tables and chart E indicate that for 1973, the revision was \$26.6 billion, or 3.0 percent. For 1974 and 1975, the revisions were \$41.3 billion (4.1 percent) and \$51.9 billion (5.3 percent), respectively.

The patterns for the revised total new orders series and for the revised durable goods new orders series are very similar to those shown in the old series. Charts A and E compare the total new orders as previously published and

as revised, while charts F and G show the month-to-month percent change on both bases. The average month-to-month change in new orders (without regard to sign and prior to seasonal adjustment) also provides a measure of the volatility of the series. This measure indicates that there are no significant differences between the new and old series. For total new orders, the average month-to-month change of the old series was 4.7 percent for 1973-1975, compared to 4.4 percent on the new basis. For durable goods, the comparable percentages are 5.3 and 5.1. For individual industry categories where unfilled orders were significantly revised, the average month-to-month movement was affected, but to a lesser degree. A comparison of the volatility for 1973-1975 on both the new and the old basis for the major series are shown in the comparison tables.1

For all series shown in this report, the data beginning with January 1958 have been revised to conform to the 1972 SIC. Data prior to this period are comparable at the total durable and nondurable levels and for selected series that were not affected by the revision in the 1972 SIC. Appendix H shows the impact of the SIC revision on an annual basis. The comparability of the data prior to 1958 is also affected by the seasonal adjustment process and is discussed in the section on seasonal adjustment.

## II. DESCRIPTION OF THE SURVEY

The Manufacturers' Shipments, Inventories, and Orders (M3) survey provides monthly shipments and inventory figures that are comparable to the totals published in the annual survey of manufactures (ASM). The ASM is a sample survey of approximately 70,000 manufacturing establishments drawn from the 5-year census of manufactures universe of about 321,000 establishments. In the ASM, each manufacturing establishment reports data on employment, payrolls, shipments, cost of materials,

<sup>&</sup>lt;sup>1</sup> Comparison tables will be issued as a supplement to this publication.

<sup>&</sup>lt;sup>1</sup>Comparison tables will be issued as a supplement to this publication.

capital expenditures, and inventories, as well as other selected items. The establishments do not provide information on unfilled orders or new orders.

#### A. Composition of the Survey Panel

The monthly M3 estimates through 1976 are based on information obtained from approximately 3,800 reporting units and include virtually all companies with 1,000 or more employees, as well as selected mediumsize companies that strengthen the sample coverage in individual industry categories. For single-industry group firms, the reporting unit typically comprises all operations of the company. At the request of the Census Bureau, most large diversified companies file separate reports for divisions which operate in different M3 industry groupings.

Each company or division of the company in the sample is classified into one of the 75 industry categories for which separate estimates are made (see appendix B), based on the major activity of the reporting unit. Some reporting units include industry activities outside the M3 industry category in which they are classified. The survey methodology assumes that the month-to-month changes of the reporting units classified in each industry category effectively represent the month-to-month movements of the establishments in the SIC industries which comprise the category.

The sample selected in 1962 for this survey included all companies with more than 1,000 employees. Smaller companies were sampled proportional to their employment size. Because of poor response rates, reporting by companies with less than 100 employees was discontinued in 1963 and instead were estimated by using overall industry averages. In the intervening years, work continued on obtaining divisional reports from large diversified firms and on obtaining voluntary participation of all firms with 1,000 or more employees. This effort was intensified in the early 1970's as increased funding was made available. Virtually all such companies now report.

There was also some deterioration in response rates for companies between 100 and 999 employees. Therefore, in January 1975, a supplemental sample of approximately 1,000 companies was selected from the universe of companies with 100 to 999 employees in order to strengthen the estimates. Approximately 60 percent of the companies from this supplemental sample are now reporting, and their reports will be used to prepare the monthly estimates beginning early in 1977.

#### B. Monthly Estimation Procedure

The monthly estimates of shipments, unfilled orders, and total inventories are derived for each industry category by multiplying the estimate for the previous month by the percentage change from the previous month for companies reporting in the current month.<sup>2</sup> The previous month's data for an individual firm can be either reported or imputed. This is a change from the procedure used prior to 1975, when reported data for current and previous month were both required for a company's inclusion in the current month's estimate. From time to time, an individual company report may show unusually large changes from the previous month which differ substantially from the movement shown by the rest of the reporting panel. An example of this is the effect of a strike upon an individual company. Such extreme movements are isolated from the estimation procedure as follows: the data for the individual company are removed from the computation of the aggregate month-to-month percentage change and from the prior month's estimate; the modified percentage change is then applied to the reduced prior month's estimate, giving a current month's estimate of the entire industry excluding the company with the unusual monthto-month change; finally, the company's reported data are added to the modified current month's estimate to obtain the estimate for the entire industry. The effect of this procedure is to restrict the basis of estimation for nonrespondents to the general trend of the industry.

The seasonally adjusted estimates for each M3 industry category are calculated by dividing the unadjusted

estimates by a seasonal adjustme factor previously computed by tl X-11 seasonal adjustment program This is discussed further in the se sonal adjustment section of this repo

New orders are not calculated a cording to the standard ratio estima procedure, even though they a collected as a separate item. TI reason for this is that not all cor panies report new orders, and sor that do limit their reporting to specif products for which long lead times a required in the production cycl These companies, in effect, exclunew orders received for products th are shipped from inventory. To ta advantage of the higher response ra for shipments data and to incluorders filled from inventory, no orders are computed by adding t change in the backlog of unfill orders to the current month's sh ments. Thus, the estimate of new orders includes orders that are ceived and filled in the same mon as well as orders that have not y been filled. The estimate also include the effects of cancellations and mofications of previously existing cc tracts.

Seasonally adjusted new orde are computed by adding the differen between the seasonally adjusted u filled orders for the current and preous month to the current month seasonally adjusted shipments. Th procedure preserves the definition: identity between shipments, unfilled orders, and new orders, although will yield seasonally adjusted ne orders estimates which differ from a independent seasonal adjustment new orders. The nature of these d ferences will be studied during tl coming year to evaluate the relati merits of each of the two season adjustment procedures.

The estimation of total inventorie follows the standard procedure prevously mentioned. However, because a significant number of companies that report total inventories cannot report inventories by stage of fabrication, a modified procedure is used to estimate the stage-of-fabrication dat. In this procedure, the inventory total previously estimated are cumulated to 2-digit SIC levels and serve as control totals for the stage-of-fabrication data. Initial estimates by stage of fabrication are made for each 2-digit stages.

<sup>&</sup>lt;sup>2</sup> This procedure is explained in greater detail in Series M3.1, *Manufacturers' Shipments, Inventories, and Orders, 1947-1963 (Revised).* 

SIC based on the link relative method for reporting companies; the differences between the sum of the stageof-fabrication detail and the total inventories are then allocated proportionally to the stage-of-fabrication figures to form the estimates. Each stage-of-fabrication estimate is adjusted by the appropriate seasonal factor to obtain seasonally adjusted figures; and once more the difference between the sum of the seasonally adjusted stage-of-fabrication inventories and the seasonally adjusted total inventories is proportionally allocated to the stage-of-fabrication detail.

#### C. Limitations of the Data

The monthly data presented in this publication are subject to both sampling and nonsampling errors. Sampling errors occur because reports are received from a sample, and not from the complete universe of manufacturing companies. Because of the present composition of the sample, the amount of sampling error cannot be quantified. Nonsampling errors, on the other hand, are attributable to many sources. The use of company or divisional reports to estimate the monthly change for establishments may be one source of nonsampling error. In addition, response and processing errors may be present, although it is believed that most of the important errors of this kind have been detected and corrected in the reasonableness and consistency review of the data prior to publication. The benchmarking of shipments and inventory data corrects systematic errors in the estimates of level, on an annual basis, for these statistics. Other qualifications of the data, particularly for unfilled orders and new orders, are discussed in sections III.B.5 and III.B.6.

#### . REVISIONS TO PREVI-JSLY PUBLISHED DATA

e data included in this report revise information previously published for period January 1958 to September 76. The five major reasons for revisions discussed in detail below. In addition, a result of the detailed review to which data were subjected, other errors in porting or processing were detected of corrected. These corrections have

been carried to the data contained in this report

## A. Benchmark Procedure for Shipments and Inventories

#### 1. Standard Procedures

Periodically, the estimates of annual shipments and end-of-year inventories derived from the monthly survey are benchmarked to the annual totals compiled in the census and in the ASM. This benchmarking adjusts for any differences that may result from collecting the monthly data on a divisional or company basis as compared to the establishment basis used in both the annual survey of manufactures and the census of manufactures. It also corrects for errors of estimation from the relatively small monthly survey and for any reporting or processing errors that may not have been detected as part of the review of the monthly estimates. The last previous benchmark report was issued in July 1973 and was benchmarked to the annual data through 1971.

The benchmarking process involves comparing the monthly reports with the annual reports (Form MA-100) for individual companies and reconciling large differences. Some differences are to be expected, as the monthly reports are for companies or divisions of companies while the annual reports are for establishments. Corrections are made to the monthly estimates for both response errors and processing errors. The corrected monthly estimates are then adjusted to the annual benchmark levels for shipments and to the December year-end figures for inventories. In both processes, the original month-to-month movements are preserved to the maximum extent possible. Stage-of-fabrication inventories are benchmarked in the same way and then balanced to the total inventories. For both sales and inventories, the data are extrapolated forward for the months following the benchmark year (in this case, 1974 through 1976) by using the original month-to-month movements. However, corrections were made for individual errors in the monthly movements prior to this extrapolation.

Since benchmark data are not available for unfilled orders, an alternative procedure was developed for adjusting this series. This method is described in section III.B. Finally, new orders are recomputed based on the revised shipments and unfilled orders data.

Table A-1 shows the shipments and inventory data as originally published for 1972 and 1973 and as revised after benchmarking. Total shipments was revised upward by \$11.8 billion or 1.6 percent for 1972, while for 1973 the change was \$17.7 billion or 2.1 percent.

For total inventories, the revisions in billions of dollars were \$.2 for the end of 1971, \$.6 for the end of 1972, and \$4.1 for the end of 1973. Based on these revised estimates, the changes in inventories during 1972 and 1973 were \$5.7 and \$16.4 billion, respectively. This compares with the original estimates of annual change of \$5.3 and \$12.9 billion.

The M3 shipments and inventory data for 1974 have not been benchmarked to the 1974 ASM estimates because the ASM data were not available when work on this benchmark publication was started. However, the ASM data became available before this publication was completed and was used to identify problem areas. As a result, the 1974 M3 data are now much closer to the ASM estimates. For example, the ASM estimates for 1974 showed an increase in inventories of \$33.5 billion. The originally published M3 estimate reported an increase of \$29.5 billion. This has now been revised to \$33.8 billion.

The problems encountered in measuring inventory change have been greatly exacerbated by rapid inflation and the consequent conversion by many firms to Last-In-First-Out (LIFO) accounting. In view of this situation, an intensive review of the inventory data was initiated by the Census Bureau. A contract to review this problem independently was awarded to the National Bureau of Economic Research (NBER). A final report on the NBER research will be issued in mid-1977 and will recommend significant changes in respondent reporting requirements designed to improve the measurement of real inventory change.

#### 2. Other Adjustments

In carrying out the standard benchmark adjustment, some other changes were introduced. In the census years (1958, 1963, 1967, and 1972), beginning as well as ending year inventories were collected. In the previous benchmark revisions, the census inventory figures as of the end of 1962, 1966, and 1971 were linked to the ASM estimates, rather than the beginning of the year figures which were available from the censuses of manufactures. As the census figures represent complete universe enumeration and are not subject to sampling error, these figures have been used in this revision.

A special problem occurred in 1971 which requires some additional comment. At the end of 1971, the figure for total manufacturing inventories based on the ASM sample was \$102.1 billion. However, the 1972 Census of Manufactures figure for total inventories at the beginning of 1972 was \$103.0 billion. This \$.9 billion difference was due largely to problems with coverage in the ASM sample, which also affected the ASM estimates for 1970. Therefore, the discrepancy between the census and ASM figures for 1971 inventories was allocated partially to 1970 to avoid distorting the 1970 to 1971 year-to-year movement. Although a similar problem occurred in previous census years, the magnitude of the problem did not warrant a special procedure.

Finally, several revisions made to the 1963-1967 data as part of the 1967 Census of Manufactures have been carried back to the 1958-1962 data. The major revisions were in office and store machines, automotive parts, and other fabricated metal products. Additional changes were made where the historical benchmarks used for this survey were revised in the census or annual surveys after the benchmarking for that year had been completed.

#### B. Unfilled Orders Revision

The unfilled orders data previously published in the series have been substantially revised, as shown in charts A, B, and E and the comparison tables. These changes were made after a detailed review indicated that the operational and statistical methodologies being used resulted in an understatement of the levels. In addition, some conceptual problems were identified in the estimation and adjustment methodology which may have had some impact on the data.

While it is believed that the revised figures represent an improvement in the measurement of the levels for the unfilled orders series, a statistically reliable level is still not known. Unlike the shipments and inventory data, there are no benchmark estimates of the levels for unfilled orders which are based on a large-scale survey such as the census or ASM. Plans which are underway to develop such estimates of level are discussed later in this section. In addition, alternative methods for making current monthly estimates of unfilled orders are being investigated.

In total, the unfilled orders estimates as of the end of 1975 are revised from \$119.7 billion to \$170.2 billion, or an increase of 42.2 percent. The comparable change for 1973 was \$44.5 billion or 38.3 percent, while for 1969 it was \$30.7 billion or 36.1 percent.

The revision to unfilled orders also affects the new orders data, although the impact of the change is reduced, as new orders, as previously noted, are derived by adding the change in unfilled orders between the current and previous months to the shipments estimate for the current month. The comparison tables and charts A and E show the original and revised new orders data since 1962. For 1973, new orders were revised upward by \$26.7 billion or 3.0 percent, while for 1975 the revision was \$51.9 billion or 5.3 percent. A part of the new orders revision is due to the benchmarking of the shipments data, while the updating of all of the seasonal factors also results in some changes to the seasonally adjusted monthly data. This is discussed in greater detail in section IV.

In view of the procedural changes that have been introduced in this

report, the important aspects of the new and old procedures have bee summarized.

## 1. Setting of the Original Levels (Unfilled Orders (August 1962)

The absence of an independent annual benchmark for unfilled o ders has affected this series from its inception. Since there was n benchmark level, it was necessar to develop a proxy level when th Census Bureau assumed respons bility for this survey and issued i first report. This was done b assuming that the unfilled order shipments ratio for responden could be used to develop industr estimates. As most reports file by companies in this survey wer company or divisional reports reporting commercial sales and un filled orders, it was assumed that the reported unfilled orders/ship ments ratio for commercial sale was the same as for within-compani transfers. The estimation procedured which was applied to each industr category, is summarized as follow:

- a. The shipments and unfille orders data were tabulated fc all companies reporting bot shipments and unfilled order: These reported figures generall represented commercial transactions with other companie: Large companies reporting ship ments and not unfilled order were contacted to obtain a one: time estimate of their unfilled orders, or the figures were estill mated using the unfilled orders shipments ratio for simila companies.
- b. Unfilled orders for othe companies in the sample that reported shipments but did no report unfilled orders were estimated using one-half the ratio of unfilled orders to shipments fo respondents as determined in step a, above. This was done or the assumption that some of the companies not reporting unfilled orders had zero unfilled orders while others had approximately the same relative amount or unfilled orders as respondents but for various reasons could not report. Special treatment was also accorded to a few industries.

c. The combined unfilled orders/shipments ratio for companies reporting both items and for companies reporting sales only was applied to the published ASM shipments data for the industry category. This procedure imputed unfilled orders data for those companies not reporting in the monthly survey. As the ASM shipments data include shipments between manufacturing plants of the same company as well as commercial sales, the resulting unfilled orders estimate includes estimated commercial orders and orders for within-company transfers.

## 2. Carrying the Original Estimates Forward

The original estimates of unfilled orders were carried forward from the levels set in 1962, using the month-to-month percentage change procedure as described in section II.b. This is referred to as the link-relative method.

### 3. Periodic Adjustment of Unfilled Orders

Beginning in 1968, the M3 shipments and inventory data were adjusted to the benchmark levels of the census or the ASM. Since benchmark levels were not available for unfilled orders, an alternative procedure was used. Generally, the objective was to maintain the originally compiled unfilled orders/ shipments ratio. Therefore, an adjustment in the level of unfilled orders was usually made which was proportional to the change made in shipments for each industry category. This "proportional" adjustment procedure assumed that the relative errors in the orders and shipments estimates are highly correlated and that any adjustment in shipments should result in a proportional adjustment in orders.

### 4. Problems in the Estimation and Adjustment Procedure

It was thought that the link relative monthly estimates with the periodic annual adjustment, described above, should result in estimates of level for unfilled orders consistent with estimates that would be obtained if the procedure used originally to set the level in 1962 were to be repeated. Over the years since 1962, however, for some series the estimated unfilled orders level became substantially different from the unfilled orders level that a replication of the 1962 procedure would have produced. In some cases, the deviation was so large that the published level fell below the actual amounts reported. The existence of these large differences led to a detailed review of the unfilled orders series and of the methods of estimation that were used, to determine the causes of the differences and the extent to which revisions to the series should be made.

The results of this review indicated that there is no mathematical basis for determining whether the link-relative periodic adjustment procedure or resetting the levels would result in better estimates. Both methods have unknown amounts of bias due to the limitations of the present M3 panel for smaller companies with less than 1,000 employees.

In re-examining the link-relative procedure, both methodological problems and processing errors were uncovered. Errors made in carrying out the periodic adjustment procedure appear to be the most important source of differences between the old series and the estimates based on resetting levels. The extent of these errors could not be quantified, as other corrections were made to the unfilled orders series at the same time that the periodic adjustment revisions were made, and the documentation of these corrections is no longer available.

A second source of possible problems exists in the methodology of the old estimation procedure. Although the contribution of these methodological problems to the observed differences in the old and reset level series also cannot be quantified, the theoretical limitations of the old procedures include the following:

a. The estimate of the percent change from the previous month (which is applied to the previous month estimate of level) was based only on companies reporting in both months. If a company's relative change in unfilled orders differed from the industry average during a period when the company did not report, the change would not be reflected in the initial monthly estimate. A change in procedure was introduced in 1975 which adjusts for companies which do not report periodically.

- b. A special adjustment was made for companies reporting a change in unfilled orders that was substantially different from the rest of the industry. If a company had a very large new order, not considered to be representative of the industry, the company was excluded from the estimate of the percent for nonrespondents. change (This procedure is described in more detail in section II.B.) This provides an improved estimate of month-to-month change. It is not clear what the longterm impact of this action is on the unfilled orders level, but it does introduce some bias into the estimates. This problem is now being reviewed and the process may be modified in the future, particularly with the supplementation of the present panel by a representative sample of the smaller companies.
- c. While the use of a linkrelative estimating method will produce a good estimate of month-to-month change, the sampling error in the estimate of level tends to increase over time, even with a constant survey panel. With a sample panel that is not constant over time (as in this monthly survey) due to the occasional nonresponse by reporting companies as well as structural changes in industry, such as mergers and acquisitions, the likelihood of error associated with the linkrelative estimates is increased.
- d. There is an implicit assumption in the estimation procedure that the change in unfilled orders for those companies reporting

shipments and unfilled orders is similar to the change in unfilled orders for companies in the survey panel reporting shipments but not unfilled orders. While this assumption may generally be justified, it is probably not true for all industries and may have an impact on the level of unfilled orders.

Some of the errors of level may be reduced or eliminated by the periodic adjustment procedure. However, the effectiveness of this adjustment procedure depends on how well correlated the errors are in the estimates of level of unfilled orders and of shipments. All of the above problems have the potential for introducing errors into the unfilled orders estimates that are not correlated with errors in the shipments estimates.

### 5. Current Revision of Unfilled Orders

Because of these operational shortcomings and the possible problems associated with the methods of estimation, it was concluded that the resetting of levels, using the original 1962 procedure, would result in better estimates of level for unfilled orders until a true benchmark level could be established. Neither the old nor the new procedure can properly estimate for nonrespondents with atypical characteristics.

#### a. Resetting the levels

In order to reset the level, specific industries were identified for revision based upon a preliminary estimate of the new level for each industry category. The industry was selected for revision if the amount of the revision was estimated to exceed \$1.3 billion as of the end of 1973 or if the total unfilled orders reported in the survey panel exceeded the currently published estimates. Using these criteria, 26 industries were selected. The unfilled orders published for these industries as of the end of 1973 amounted to \$79.5 billion before revision and \$122.8 billion after revision. The remaining 25 industries for

which unfilled orders were compiled accounted for \$35.8 billion in unfilled orders as of the end of 1973 and were not revised.

The procedure used for originally setting the 1962 estimates, as defined in section III.B.1, was generally repeated for the current adjustment, with the levels reset for December 1969 and December 1973.

Two procedural changes to the original level-setting method were introduced. The first change relates to the 1962 procedure of imputing unfilled orders for companies only reporting sales, based on onehalf the unfilled orders/sales ratio for companies which report both items. A modification to this procedure was needed for 1969 and 1973 because there has been a sizeable reduction in the reporting panel of the salesonly respondents since 1962, primarily in the small- and medium-size company categories. Therefore, to maintain consistency with 1962 data, sales data were first estimated for nonrespondents as if they had continued to report monthly. The upper limit to the reported plus estimated sales was the published sales estimate for the period. Unfilled orders were then imputed for nonrespondents and respondents reporting sales only, at one-half the orders/ sales ratio determined for respondents. As in 1962, some special procedures were used for individual large companies and industries.

The second procedural difference involved the computation of the orders/shipments ratio based on the annual sales rather than the monthly sales. This enabled the use of estimated data for individual companies that generally report, though they might have not reported for the specific benchmark month. It is also believed that the use of annual sales data eliminated some random errors that may have occurred in highly volatile sales series, thereby improving the results.

For each series selected fo level resetting, a detailed comparison of the 1962, 1969, and 1973 reporting samples wa made to insure that distortion resulting from changes in the reporting panels were not introduced. For the internal com bustion engines, aircraft parts and industrial apparatus indus tries, where the sample coverage was poor in 1969 but had im proved by 1973, only the 1973 level was reset. In addition, sinc 1969, the basic monthly source documents are still available Where the data appeared ques tionable, the original materia was reviewed and correction were made where necessary

These procedures were applied to 26 of the 52 industries for which unfilled orders data and compiled. For the 26 remaining industries, the unfilled order data were not changed for any period, as the preliminary estimate indicated that any change would have a relatively small impact on the overall order level.

Four industries were removed from the group for which un filled orders data are compiled The first industry was the al other wood products industry for which the December 197; estimate of orders on the old basis was \$.4 billion. The order information was reported only by some of the smaller com panies accounting for 13 per cent of the shipments, while most of the larger companies dic not report orders data. A num ber of the larger companie: were contacted and they indicated that they did not produce to order and did not maintain order backlogs. Under these circumstances, it appears that the orders data apply only to a small portion of the industry that may be involved in some specialized production and that an estimate made for the entire industry based on such reporting would be in error. Since it was not feasible to split the industry into several components, unfilled orders were dropped for the entire industry.

The review of the order backlog information reported by the farm machinery and equipment industry showed a similar situation. In this industry, sales data are reported monthly by companies accounting for approximately 75 percent of the industry's sales. However, unfilled orders data are reported by companies accounting for less than 15 percent of the sales. In discussing this with some of the largest producers and the industry trade association, Census staff were told that the industry generally does not produce on order. Instead, shipments are made from inventory and production schedules are based on detailed forecasts. Unfilled orders data, even where reported, appear to be dealer orders for specific delivery dates. Therefore, the estimation of the order backlog for this industry has been discontinued and new orders have been equated to shipments. On the old basis, the end of 1973 estimate of unfilled orders for this industry amounted to \$.1 billion.

The knitting mill industry was also removed from the group for which an unfilled order backlog is computed. As of the end of 1973, the order backlog on the old basis was less than \$.1 billion. This industry group reported very poorly in the 1962-1973 period, with a number of the respondents reporting intermittently. The month-to-month movement based on this small sample was questionable. Without a solid basis for estimating the monthly change or the level of unfilled orders, the unfilled orders series for this industry was discontinued.

The backlog of unfilled orders for the all other transportation equipment industry also was discontinued. This industry was split into two parts as a result of the revision to the SIC: part of the industry—mobile homes—was reclassified into a new industry—wood buildings and mobile homes—and the balance of the industry (pri-

marily bicycles, motorcycles, and recreational vehicles) remained in the all other transportation industry. While some respondents report a backlog of orders in this area, the general level of response in these industries is not sufficient to warrant estimation of backlog separately in the new industries, either for the historical time series or for current months.

#### b. Monthly estimates

After the new levels were reset, it was necessary to develop monthly data. Two alternatives were considered, the originally published month-to-month movements which exclude the earlier periodic adjustments, and the currently published movements which include the periodic adjustments. These data were charted and compared to the new reset levels. It appeared that the originally published monthto-month movements resulted in estimates which were much closer to the reset levels. Moreover, the substantial changes which were introduced in the 1971 annual adjustment tended to distort some of the currently published month-to-month movements. Therefore, the originally published month-to-month movements were used, even though this procedure results in losing some corrections that were made earlier and for which records are no longer available.

The remaining series, as mentioned earlier, were not reset because their estimated reset level did not significantly affect the overall levels of unfilled orders. For these series, the monthly unfilled orders estimates which include the earlier periodic adjustment were not changed. However, as it is not clear that the periodic adjustment necessarily improves the estimates, the periodic adjustments for 1972 and 1973 were not made.

## c. Limitations of the Unfilled Orders Level

The data included in this survey are subject to the limitations discussed earlier resulting

from the inadequacies of the sample and the use of company/divisional reports to estimate changes for establishment-based data. In addition, the new levels of unfilled orders are subject to other limitations because of the assumptions made in developing the new levels, the definitions of unfilled orders, and response difficulties.

One of the major assumptions is that monthly respondents reporting sales but not orders have an orders/sales ratio equal to half the ratio computed for respondents reporting both sales and orders. The need for this assumption will be largely eliminated by conducting a full-scale benchmark survey as discussed in section 7.

A more difficult assumption to evaluate is the one that assumes that the orders/sales ratio for intracompany sales is equal to the orders/sales ratio reported for customer sales. This assumption was made because it seemed reasonable that a company making a product acted in the same way regardless of where the order came from. The assumption was also necessary in developing unfilled orders data consistent with the shipments data. Moreover, without this assumption, it would be very difficult to compute meaningful new orders estimates. It is unlikely that any actual data can be compiled to either prove or disprove this assumption. Almost all of the companies with whom this question has been discussed indicated that orders for intracompany transfers are not reflected in dollar amounts in accounting records. This is especially true where the producing and receiving plants are both included in one division for profit and loss computation. Instead, such orders are usually controlled in quantity terms by the production department.

The impact of each of these assumptions varies by industry depending upon a number of factors, such as the response rate for the industry, the reason for nonresponse, and to some extent

the quality of the response. While for some industries, respondents accounting for a relatively large proportion of the industry's sales report unfilled orders, in other industries, the relative proportion of companies reporting orders as compared to those reporting sales is relatively low. The office and store machines industry and the other stone, clay, and glass industry are among the more important categories with this relatively low response rate.

In order to obtain additional information regarding response problems, a number of companies were questioned regarding their reporting. This was done as part of a more general recordkeeping interview survey. It was found that there are some conceptual problems in industries where orders are shipped within a relatively few months after receipt, such as textiles, lumber, furniture, etc. They are much less applicable to long-leadtime industries which make customdesigned large products such as aircraft, ships, etc. The longleadtime industries which tend to dominate the unfilled orders level have generally expressed much less difficulty in reporting.

For the short-leadtime industries, the compilation of unfilled orders data can present difficult problems. Some of the more important ones mentioned were that orders records are maintained in quantity rather than in dollar terms. Where the product mix was highly variable from period to period, the conversion to dollars was difficult. Moreover, because of this product mix, some companies indicated that their major reliance was on the quantity data which is used for production scheduling, while little value was placed on aggregate dollar amounts. The orders data may be maintained in the production or sales departments and not included in the records of the accounting department that normally files the monthly M3 reports. These are important contributing factors to nonresponse.

Other companies, including those that report orders as well as those that do not, discussed the difficult concept associated with new orders. For example, while the Census definition indicates that the orders should be supported by binding legal contracts, this is frequently not the case. Some companies reported that while the orders may theoretically be legally binding, for all practical purposes the orders may be cancelled with relative ease, and frequently they are. Given these qualifications to the concepts, there are frequently big differences in the importance attached to orders backlog by individual companies in a single industry. Some companies place little reliance on them, while others consider orders to be quite important. The differences in treatment of orders by individual companies could influence the actual size of their orders backlog and whether or not they report. To the extent that individual companies report in a consistent way, which they seem to do, the month-to-month movement could be reasonably accurate even though the level might be questionable.

#### 6. Current Revision of New Orders

Since new orders for any period are defined as the change in unfilled orders between the current and previous periods, plus the current period shipments, a revision in either of the two basic series will result in a change in the new orders estimates. The comparison tables show the originally published and revised new orders data for all industries by year since 1962.1 The comparison tables also show the same data by month since 1974.1 In addition, the table shows the siginificance of the shipments revision as well as unfilled orders revisions. For 1975, new orders are revised upward by \$51.9 billion or 5.3 percent, while the estimate for the durable goods industries was revised upward by \$25.4 billion or 5.3 percent.

These revisions do not chanthe underlying movement of the total new orders series or of tll durable goods new orders series shown in chart E. This chart based on data prior to seasonal a justment. Seasonally adjusted da are not used for this compariso because the updating of the season factors introduces some noncor parability. Similarly, charts F and show the month-to-month percer age changes for both series. Th revised new orders series for each industry category is also general comparable to the previously pu lished new orders series, although the average month-to-month pe centage change in the new serimay be greater than in the o series.

The revised new orders estimate like the unfilled orders and shi ments estimates from which the are derived, are subject to erro due to the sample composition ar the use of company/divisional r ports to estimate changes for estal lishment-based data. Other erro in the new orders series may be duto the assumptions in the unfille orders estimation method and t response problems previousl discussed.

#### 7. Future Benchmarking Plans

In order to place the estimate of level of unfilled orders on an improved basis, it is necessary to compile independent benchmark esti mates from the universe of manufacturing companies. As part of the program to accomplish this, a ques tion regarding the end-of-year back log has been added to the ASN report form for 1976 which will be used for companies operating at a single location. In addition to obtaining an estimate of their overal backlog, information will also be obtained indicating whether they normally ship on order or from stock, and whether the order is usually filled within one, two or three or more months after receipt.

For most companies operating at several locations, collecting unfilled orders data on an establishment basis is not possible. This is especially true for the large complex companies that are organized on a

<sup>&</sup>lt;sup>1</sup> Comparison tables will be issued as a supplement to this publication.

divisional basis. As part of the recordkeeping practices interview, Census staff found that the records maintained by manufacturing companies are usually limited to customer orders for the operating divisions and are not allocated back to individual establishments. Therefore, the Bureau is planning to conduct a special divisional-type survey for multi-establishment firms to collect unfilled orders data to develop the benchmark levels.

It is expected that sufficient programs will be made in solving these problems to enable the Census Bureau to initiate the unfilled orders survey for multi-establishment companies early in 1977. This survey will collect orders data as of the end of 1976, together with annual sales information.

#### C. The SIC Revision

The standard industrial classification (SIC) was revised for 1972, Beginning with the data collected in the 1972 Census of Manufactures, annual data collected in the censuses and annual surveys of manufactures are based on the 1972 SIC, which differs extensivev from the 1967 SIC. The extent of these differences is shown in the appendixes to the SIC Manual and in the 1972 Census of Manufactures reports. Historical data prior to 1972 for the 75 industry categories used in the M3 series have been revised to conform to the 1972 SIC. These revisions were made by statistically adjusting the annual data using the procedures outlined below, rather than by retabulating any of the basic establishment

The only SIC changes which afected this publication are those which nvolved a definitional transfer of manufacturing activities from one M3 industry category to another. The aggregate value of shipments for plants changing M3 industries could be determined from the 1972 census data since the census provided "bridge" tabulations showing the data both on the new and the old SIC. This aggregate value was estimated annually pack to 1958 by using other available nformation such as the industry and product data compiled in the ASM, Current Industrial Reports, and, in some cases, trade association information. The annual adjustments were then applied to the M3 industry category totals based on the old SIC to derive the M3 data on the new SIC. For each segment of an industry transferred to another M3 category, inventories were also transferred by moving them in the same proportion as for sales. These estimates of the value of the shipments and inventories that moved from one industry category to another, due to the redefinitions of the SIC, along with the calculation of the new SIC aggregates on the 1972 SIC, are shown in appendix H.

#### IV. SEASONAL ADJUSTMENT

The seasonal adjustments of the shipments, inventories, and orders were made using the X-11 variant of the Census Bureau's seasonal adjustment program. This program is amply described in the literature on this method.<sup>3</sup>

The X-11 variant of the seasonal adjustment program has developed improved techniques for the treatment of extremes and a regression program to identify trading-day adjustment to the monthly aggregates. However, the trading-day routine is optional and has not been used for the M3 survey. Instead, data in the individual reports are adjusted prior to tabulation for the number of trading days as well as for any variation in the length of the reporting period. Moreover, special techniques have been used where the impact of a strike or other unusual occurrence has not been amply adjusted by the mechanics of the program. Special adjustments are used also during the model year change-over period in the automobile industry.

The computation of seasonal adjustment factors by the standard X-11 program provides for the acceptance of changing seasonals. An examination of the seasonal factors for a number

of series indicated that the computed trend in the seasonal factors was more an oscillation within a narrow band than a true trend in the seasonal pattern. In such cases, the trend in seasonality was reduced by expanding the number of years used in computing the moving averages for specific months, or eliminated altogether by using a stable seasonal.

Appendixes C through E provide the trading-day adjustments, the monthly seasonal factors, and the average percentage monthly change and related measures for shipments, unfilled orders, and inventories. New orders are not independently seasonally adjusted but are derived from the seasonally adjusted shipments and the change in the seasonally adjusted unfilled orders.

#### A. Trading-Day Factors

Variation in the rate of activity that arises from the existence of different numbers of trading days in the same month for different years can be an important cause of month-to-month irregular fluctuations. Unlike some other causes of irregular fluctuations such as unexpected economic developments, unusual weather, and statistical errors, trading-day irregularities can be approximately identified and removed so that the underlying trend-cycle stands out more clearly. Hence, it is often possible to reduce the irregular factor by a trading-day adjustment.

Considerations used in selecting trading-day adjustment factors are knowledge concerning industry practices, tests of alternative sets of factors, and derivations of trading-day factors based upon the information contained within the data.

For most series, the development of monthly trading-day adjustment factors are based upon the assumption of equal weights for Monday through Friday and half-weight for Saturday and Sunday. The logic for this tradingday pattern rests on the assumption that (1) the books in which sales records are kept are generally open Monday through Friday and that (2) about half of the sales volume each month takes place with monthly periodicity independently of the vagaries of the month-end calendar. In allowing for this half of the sales volume, equal treatment is given to Saturday and Sunday.

<sup>&</sup>lt;sup>3</sup> Electronic Computers and Business Indicators, National Bureau of Economic Research Occasional Paper 57 (New York, 1957); Tests and Revisions of Bureau of the Census Methods of Seasonal Adjustments, Bureau of the Census Technical Paper No. 5 (Washington, 1961); The X-11 Variant of the Census Method II Seasonal Adjustment Program, Bureau of the Census Technical Paper No. 15 (Washington, 1967).

Statistical tests as part of the 1962 benchmarking operation also suggested the use of the 5, 1/2, 1/2 set of daily weights. In general, the set of trading-day factors that yields the smallest residual irregular component (1) after seasonal adjustment may be considered the best. For most series, the seasonal adjustment based upon 5, 1/2, 1/2 daily weight yielded smaller changes than other alternatives.

For the few series where the 5, 1/21/2 adjustment was not appropriate, methods of deriving trading-day factors from evidence contained with the data played an important role in selecting the trading-day factors.4 These series were shipments and new orders of (a) Newspapers, periodicals, books; (b) Pulp and paperboard mills, except building; and (c) Tobacco. The selected weights for the three shipments series are given in the table below. For the shipments series, this table compares I based on the selected set with I based on the 5, 1/2, 1/2 set and I from a seasonal run with no adjustment for trading days. In all cases the tradingday adjustment is modified to convert each month to one-twelfth of a year prior to seasonal adjustment. This is the same, conceptually, as a daily average rate raised to a monthly level. These adjustment factors are shown in appendix C.

The use of a pattern of daily activity to construct monthly tradingday factors does not necessarily mean that the industry actually has such a

<sup>4</sup> For an explanation of these methods, see "The Measurement of Calendar Variation" in Seasonal Adjustment on Electronic Computers (Milwood, New York, 1958), pages 343-359.

pattern of daily activity. What is implied is a monthly rate of activity that varies partly with the number of Mondays, Tuesdays, etc., in the month.

#### B. Adjustments for Extremes

The routine X-11 procedure has been used to adjust for strikes in all areas except in the steel and automobile industries. In the steel industry a strike or the anticipation of a strike has occurred every 3 years and has altered the seasonal pattern for shipments, inventories, and orders data in these periods by creating a general pattern of heavy ordering before the strike deadline and a weak ordering rate after the contract deadline. To eliminate the effect of these irregular movements on the data, the seasonally adjusted data were developed excluding the years in which a strike either occurred or had been anticipated. After the strike years were eliminated, the remaining years were spliced together and the seasonal adjustment was then done. After seasonal adjustment, the excluded years were reintroduced with the seasonal factors being the average for the years before and after the year excluded.

The seasonal adjustment of shipments data for automotive assembly operations presents a special problem. Each year the automotive assembly plants suspend operations to retool assembly lines for the next model year cars. This results in enormous fluctuations in the July, August, and September data which do not always occur in the same month or in the same magnitude. Seasonal adjustment, therefore, cannot be done during these months in the usual manner and a special procedure is used. As the model changeover period always tall place entirely within the 3-mor period, the problem of the timi of the changeover is removed by mo fying the input data to the seasonal; justment program. The figures July, August, and September are placed with the average of the months and the series is seasona adjusted. The seasonally adjusted 1 ures are then averaged again. For pr lication purposes, the original ( averaged) figures are used to prepthe unadjusted data and the seasona adjusted averaged numbers are used prepare the seasonally adjusted dal

#### V. DEFINITION OF TERMS

As pointed out earlier, the M survey is benchmarked to the anni survey of manufactures so that it bri forward for an industry group the val of shipments and inventories as tabula annually in that establishment-ball survey. The data reported monthly the company-based reports in the M may differ somewhat from those report annually in the establishment-based ports because of differing account procedures used by the reporting co panies. However, the link relative p cedure converts these reported mont data conceptually to the equivalent the annual survey of manufactures data

#### A. Value of Shipments

Value of shipments as reported the ASM are received or receives net selling values, f.o.b. plant, af discounts and allowances and cluding freight charges and excetaxes. Where the products of industry are customarily delivered

Average Month-to-Month Percent Change (Without Regard to Sign) in the Irregular Component (I) Based on Selected Trading-Day Adjustment Compared with 5, 1/2, 1/2 and No Trading-Day Adjustments

			Selecte	d weigl	nts					
Series	M	т	w	Т	F	s	s	Selected weights	5, 1/2, 1/2 day weights	No adjust- ment
Shipments of –										
Newspapers, periodicals, books	1	1	1	1	1	1	1-1/2	1.59	3.18	1.86
Pulp and paperboard mills, except building	1	1	1	1	1	1	1/2	1.10	1.30	1.28
Tobacco products	2	1	1	1	1	0	0	2.32	2.95	3.87

the manufacturing establishment (such as in certain foods industries—fluid milk, bakery, soft drinks), the value is based on delivered price rather than the f.o.b. plant price. In the annual survey, multiestablishment companies report value information for each plant as if it were a separate economic unit. Thus, products transferred from one plant to another are valued at their full economic value—i.e., include, in addition to the cost of production, a reasonable proportion of company overhead and profits.

Included in the value of shipments are not only products made in the establishments but also those made elsewhere under contract from materials owned by the establishment. Included in shipments are the value of all products sold, transferred to other plants of the same company, or shipped on consignment. Included also are receipts of establishments in the industry for contract work performed for others, resales, receipts for miscellaneous activities such as the sale of scrap and refuse: value of installation and repair work performed by employees of the plant; and value of research and development performed at the plant.

In the shipbuilding industry, the value of work done in a given year varies considerably from the value of shipments because of the long lead time between the start and completion of a large vessel. In the annual survey, therefore, the value of work done during the year is requested rather than the value of shipments. The same procedure is followed for aircraft produced on a cost-plus contract. Aircraft produced on a fixedprice contract are reported in the usual manner when the products are shipped. Where value of work done is reported in place of shipments, the inventories are normally charged to the customer as costs are incurred and are not reported by the shipyard or the aircraft producer.

The value of shipments figures developed from the annual survey of manufactures contain duplication at the all manufacturing and industry group levels since the products of some industries are used as materials by other industries with the industry group. With the exception of motor vehicles, it is not significant at the

4-digit SIC group level. Since the M3-1 industry categories typically are groupings of industries, this duplication is significant for the all manufacturing, durable goods and nondurable goods categories and the various market groups. The significance of the duplication within the specific M3-1 industry groups varies depending on the 4-digit industry composition of these groups. It is most pronounced in a few highly integrated industry areas such as primary metals and motor vehicles and parts.

For multiunit companies the M3-1 reports received each month typically are not establishment reports but company level reports or "divisional" reports that encompass groups of establishments. The actual sales reported on the M3-1 survey are net sales and receipts from customers and exclude the duplication of interplant transfers. These reported sales are used to calculate the month-tomonth changes which bring forward the establishment-based shipments for the industry group.

#### B. Inventories

End-of-month inventories are identical in definition to the end-of-year inventories in the annual survey of manufactures. In the annual survey of manufactures, respondents are asked to report inventories of individual establishments at approximate current cost if feasible; otherwise, "at book values." Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the aggregate inventories for establishments in an industry is not precise.

Inventories are reported by stage of fabrication: (a) finished goods; (b) work in process; and (c) materials, supplies, fuel, and other inventories. In using inventories by stage of fabrication at the all manufacturing and 2-digit industry levels as well as for the durable and nondurable goods sectors, it should be noted that a finished product of one industry may be a raw material for another industry at the next stage of fabrication. Insofar as the durable and nondurable goods sectors and also the 2-digit industry groups contain industries with successive stages of processing, the same type of commodity may be included under different inventory categories in the aggregate statistics.

In some industries, there are special problems in measuring inventories by state of processing. These are industries in which products are stored under controlled conditions and where products are aged such as in the tobacco, whiskey, and cheese industries. It is not clear whether such products should be treated as finished goods inventories or as work-in-process inventories. In all these industries. substantial finished goods inventories, have been reported in the annual survey of manufactures. These data have been summarized in the inventory tables in a consistent manner for all the annual survey of manufactrues years used as benchmarks for the M3-1. The inventories reported in the M3-1 for each type of inventory are used to bring these end-of-year inventories forward each month. Even if there are inconsistencies in the company or divisional level inventories by stage of fabrication compared to the annual survey of manufactures establishment reports, the month-to-month data which are used to determine the ratio of change are consistent within themselves.

Not all companies in the survey panel report both total inventories and inventories by state of fabrication. Therefore, each inventory figure is estimated separately based on the ratio of change reported by matched companies reporting that item. The separate estimates for finished goods, materials, and work in process are then adjusted to total inventories for each 2-digit industry category.

### C. New Orders Received and Unfilled Orders

Orders as reported in the monthly survey are not of cancellations during the month. They include orders received during the period and also filled during the period as well as those orders received for future delivery. They also include the net sales value of contract change documents which increase or decrease the sales value of the unfilled orders to which they relate. Orders are defined to include only those supported by binding legal

documents such as signed contracts, letters of award or letters of intent, although in some industries this definition may not be strictly applicable as discussed in section III.B.6. In case of letters of intent, the full amount of the sales value is included if the parties are in substantial agreement on the amount; otherwise, only the funds specifically authorized to be expended are included. The respondent is instructed to deduct the sales value of partial or complete cancellation of existing orders.

Unfilled orders include orders as defined above that have not yet passed through the sales account. Generally, unfilled orders at the end of the reporting period are equal to unfilled orders at the beginning of the period plus net new orders received less net sales.

While both new orders and unfilled orders are used in reviewing individual company reports for consistency, only unfilled orders are estimated directly in the tabulated totals. New orders, as mentioned above, are derived from the shipments plus net change in unfilled orders for each industry category. This procedure is followed for seasonally adjusted data as well. Shipments and unfilled orders are seasonally adjusted independently. Seasonally adjusted new orders are derived from seasonally adjusted shipments and seasonally adjusted unfilled orders.

#### D. Industry Classification

The 75 industry categories used in the survey are groupings of 4-digit SIC industries as defined in the 1972 Standard Industrial Classification Manual as amended. The definitions are shown in appendix B. This is a change from the 1967 definitions previously used and is discussed in section III.7.C.

The coverage for many of these 75 categories is not sufficient to warrant publication of the data. In addition to limitations imposed by the size of the sample, coverage is reduced for some groupings as a consequence of consolidated reporting by some multiunit companies. A company which reports on a consolidated basis (either the entire company or a division) is included only in the one M3-1 category in which the reporting unit as a whole is

classified. Therefore, in the monthly estimates, its combined activity influences only the movement of that industry group and has no influence on the movement in the other industries represented by the report. As a result, it has been necessary to combine these 75 industry categories into 41 groups (16 SIC 2-digit groups or combinations of 2-digit groups, plus 25 additional subcategories) for the publication of shipments and total inventories. In presenting orders and inventories by stage of fabrication, it has been necessary to introduce further combinations because of the lower response rates for those items.

#### 1. Market Grouping Categories

In addition to presenting data for industry categories within the 2and 3-digit industry groups of the SIC, the M3-1 also presents the basic data in terms of markets. These groupings are designed to separate shipments of final products from shipments of semifabricated products and materials for further manufacture or for use by the construction industry, as well as to distinguish finished goods production as to durability and between consumer-type products and equipment items. Such economic time series provide useful measures for isolating the impact of changes in demand in various sectors of the economy and greatly facilitate analysis of cyclical and growth developments.5

The market grouping categories provide a breakdown between final products and materials and a further division of final products between consumer goods and equipment for business and government use.

Subtotals are provided for home goods and apparel, and for consumer staples within the consumer goods division, while materials including supplies and intermediate products, are subdivided into construction materials and all other. For reasons to be discussed later, automotive equipment is treated as a separate market grouping. The industry

composition of the market grouings is shown in appendix

In determining the 4-digit i dustry composition of the bas M3-1 industry categories, the des ability of aggregating data into the SIC 2-digit and 3-digit groups ar into market categories was a important consideration. The e tent to which separate tabulation categories could be formed had: be reconciled with the limits in posed by the sample and the r porting capabilities of multiprodu companies. Generally, industri within the same 3-digit group we treated as a unit unless there we strong indications that a separa category could be set up for a sing 4-digit industry or combinations industries within the 3-digit grou

The market grouping series very valuable in the presentation the monthly industry survey dat However, there are certain qua fications which should be take into consideration when using the figures. Foremost is that the classification system basic to the monthly industry survey is an i dustry rather than a product class fication. For this reason, the SI system yields only approxima groupings for marketing purpose Frequently the industry structure does not distinguish between fir ished goods which are sold to th consumer and the business market and intermediate products whic are to be incorporated in finproducts by other economic sector

With one exception, the marke category groupings permit direc comparisons to be made with Fed eral Reserve Board market group ings in use prior to 1971. The majo difference in the two series is th treatment of motor vehicles an parts which is shown as a separat grouping in the monthly industr survey. In the Federal Reserv Board Index of Production thi category is spread among thre groupings. The Federal Reserv Board classifies all passenger auto mobiles and motor vehicle replace ment parts in consumer goods along with automobile trailers, boa building, motorcycles and bicycles Trucks and buses are classified in equipment and motor vehicle part for original equipment in materials

<sup>&</sup>lt;sup>5</sup> The advantages of using market groupings in economic analysis have been described at greater length in the Federal Reserve Board publication, *Industrial Production*, 1971 Revision.

The monthly industry survey reports do not separate the value of cars and trucks and it would be most difficult to parallel the Federal Reserve Board categories in this respect. The Federal Reserve Board revised its series in 1971.

# 2. Household Durable Goods Capital Goods Industries

In addition to the market categories, there are two supplementary series: Household durable goods industries and capital goods industries.<sup>6</sup> The capital goods in-

dustries category is further subdivided into two components: defense and nondefense.<sup>7</sup> These categories are useful in bringing together industries that are subjected to the influence of distinct economic forces and exhibit unique patterns in shipments, inventories,

<sup>7</sup> Capital Goods Industries:

Nondefense products—Machinery, except electrical (excluding farm machinery and equipment and machine shops), electrical machinery (excluding household appliances and electronic components), and the nondefense portions of shipbuilding and military tank vehicles, railroad equipment, communication equipment, aircraft and aircraft parts, and ordnance.

Defense—Shipbuilding and military tank vehicles, communication equipment, aircraft, aircraft parts, and ordnance.

and orders. Seasonal factors are presently devloped directly from the historical data of the separate defense and nondefense portion of ordnance, communication the equipment, complete aircraft, aircraft parts, and shipbuilding industries. The separation of each industry into defense and nondefense components from January 1968 forward, in no way compromises the historical comparability of the total industry without seasonal adjustment. However, the data user should be cautioned that the comparability of the seasonally adjusted series demonstrates a potential break, particularly in the year of 1968, due to the separate seasonal adjustment of defense and nondefense components of each industry.

<sup>&</sup>lt;sup>6</sup>Household durable goods industries susehold furniture; kitchen articles and poty; cutlery, handtools and hardware; houseld appliances; ophthalmic goods, watches, sicks, and watch cases; and miscellaneous rsonal goods.

#### INSTRUCTION MANUAL

FOR REPORTING ON FORM M-3 FOR 1976
MANUFACTURERS' SHIPMENTS, INVENTORIES,
AND ORDERS

MONTHLY REPORT

#### INTRODUCTION

his manual consists of your instructions and your file copy for this report. This is the only file copy we lan to send you for the year. Please keep records of your monthly figures on it. Your cooperation in this pluntary survey will be appreciated.

- Part A below gives general instructions about your report.
- Part B explains the format of the report form and how to report the items.
- Part C gives definitions and special instructions you should use in preparing your report.
- Part D contains the reference list (file copy) of items covered in this survey.

#### Part A - GENERAL INSTRUCTIONS

#### Filing the report

turn your completed form by the specified date the Bureau of the Census, ATTN: Industry vision, Washington, D.C. 20233. We will accept sonable estimates if your figures are not available within this time period. Please use the caddressed return envelope that is sent with the report.

have designed your report form for automatic cessing by electronic computers. We would preciate your using a typewriter to enter all your figures.

this survey is not applicable to your establishment's operations, please note this fact under the 'EMARKS'' section of the report form together who a brief description of the principal products manufactured at this establishment and RETURN IE REPORT.

#### Correspondence about your report

any correspondence with the Census Bureau aut your report, please include the title of the svey and the II-digit file number shown in the aress box of your report form.

#### ▶ 3. Confidentiality of data

Your report to the Census Bureau is confidential by law (Title 13, United States Code, Section 9). It may be seen only by sworn Census employees and may be used only for statistical purposes. The law also provides that copies retained in your files are immune from legal process.

#### ▶ 4. Publication of results of this survey

The Census Bureau will publish industry totals in the Current Industrial Reports, Series M-3-1, as soon as possible after the necessary reports are received. Companies reporting in this survey can obtain copies of this publication without charge upon request to the Bureau of the Census, Publications Distribution Section, Room 1121, FB-4, Washington, D.C. 20233.

#### ▶ 5. Componies receiving blank report forms

The Product Reference List (file copy) included in the Instruction Manual should be reviewed carefully to determine which of the products covered are applicable to your company. The descriptions and item codes for these products should then be transcribed to the report form along with the respective current and previous period data. Please review part B of the Instruction Manual on "How to Report" for correct entry of your data.

You may call (301) 763-2502 for assistance in completing the report form.

#### YOUR FILE COPY IS INCLUDED IN THIS MANUAL

# APPENDIX A. Report Form and Instruction Manual (M-3)—Continued Part B – HOW TO REPORT

▶ 1. Reporting of data - Complete part I as shown in the following illustration. All of the items included in this survey are preprinted in part I and correspond to the detail shown on your file copy in this manual.

	PARTI	Section A CURRENT REPORT			СТІ	Section Sectio	n B REPORTS	
STEP 1: Mark box which best de- scribes current reporting period.		For each item listed below, enter figures for current period or mark "Mone" in column (d). (See par. 5.)	Product code	Item (3) Description	Unit of measure	Item code	Amount for this period in unit of measure shown in column (b) iEnter figure or mark None)	THE FIGURES WERE BEPOR PREVIOUS T	TED FOR THE	this form was pre- pared. Please enter figures for
step 2: For each item listed in column (a), use ——unit of measure		-	(b)	(c)	(d) <b>N</b> one	(e)	(0	both current and previous periods.
shown in column (b), and ENTER figure or mark "NONE"					-			STEP 3: Compare figures for current and previous
for current period in column (d).				-				periods. Correct previous periods if wrong. Explain substantial differ-
					,			ences in "Remarks." (See par. 4.)

#### ▶ 2. Person to contact

Enter the name and telephone number of the person to contact regarding this report, if it is not preprinted on the form. If the preprinted name or telephone number is wrong, cross it out and enter the correct information.

#### ▶ 3. Revisions to previous data

We may have changed some of the figures you originally reported either as a result of correspondence with you or because the figures were not consistent with other items you reported.

Please review all the preprinted figures. If any need revision, cross them out and enter the correct ones above them.

If revisions should be made to figures for periods which are not shown on the form, please indicate the necessary corrections in "Remarks."

▶ 4. Significant changes in month-to-month operations If there are significant changes in the figures between months, please use the remarks section to explain these differences. If the differences are the result of changes in ownership of the company, the acquisition of other companies, or reorganization

within the company, please note this in part II and/or part III (page 2 of the report form). In part III, Mark "No" if the current month's report is no longer comparable to the prior month's because it includes establishments recently acquired from another company or as a result of reorganization within the company. If you have acquired another company, but are not including it in any existing M-3 report, please note this in the remarks.

Be sure to enter all changes on the file copy of your report farm.

#### ▶ 5. Reporting period

Although this survey is designed to cover a calendar month's activity, you may be reporting your figures for a different period of time. So that we may convert the reported data to a calendar month equivalent, always give the period actually covered by your report.

In part I of the form, mark the box which best describes the period for which you are reporting. If your records are for thirteen 4-week periods, please enter in "Remarks" the exact dates covered by your report.

# APPENDIX A. Report Form and Instruction Manual (M-3)—Continued Port C – DEFINITIONS AND INSTRUCTIONS

**NOTE:** The instructions below apply to Forms M-3, "Manufacturers' Shipments, Inventories, and Orders," M-3-1, "Manufacturers' Shipments and Orders," and M-3-2, "Manufacturers' Inventories."

#### ▶ 1. Scope of Survey

This report should include all activities of the company or division of the company designated in the address box. (Operations of foreign subsidiaries or foreign branches (including Canada) should be excluded.)

#### 2. Definitions

Shipments or Net Soles — Include total company billings net after discounts and allowances exclusive of nonmanufacturing activities. Include sales of products and services to other companies, individuals, U.S. Government agencies, and foreign customers. Sales by foreign subsidiaries should be excluded. Transfers within the reporting unit should also be excluded. Transfers to other reporting units should be included.

Net New Orders Received (New Orders Received Less Concellations) - Include (a) the sales value of orders received during the reporting period for products and services to be delivered at some future date; (b) the sales value of orders for immediate delivery which have resulted in sales or shipments during the reporting period; (c) the net sales value of contract change documents which increase or decrease the sales value of the orders to which they are related when the parties concerned are in substantial agreement as to the amount involved. Include as orders only those orders that are supported by binding legal documents, such as signed contracts, or letter contracts. In the case of letter contracts the full amount of sales value should be included if the parties concerned are in substantial agreement on this amount; otherwise, only the funds specifically authorized to be expended should be included. Deduct the sales value of partial or completed cancellations of existing orders.

Unfilled Orders, End of Month — Include orders that have not yet passed through the sales account. Generally, unfilled orders at the end of a reporting period are equal to unfilled orders at the beginning of the period plus net new orders received during the period less net sales.

Total Inventory, End of Month — Include the book value — by whatever method derived — as carried on your books of all goods owned by you, wherever located in the U.S. and at all stages of fabrication. Do not include inventories of foreign subsidiaries. The inventories should include goods held at sales branches. Do not include goods in which the title does not lie with you such as Government or customer-owned goods. Goods-in-transit should be included only if you have taken title. Inventories should be reported gross of progress or partial payments. Where possible, a notation of the amount of such payment should be made in the "Remarks" column.

Material and Supplies — Include all raw and semifabricated commodities and supplies, the title to which has passed to you but which have not yet undergone any processing by you.

Goods in Process - Include all commodities undergoing fabrication within your plants.

Finished Goods - Include all products on which your processing has been completed and which are ready for shipment to customers. Also include all stocks of goods bought for resale without further processing.

Inventories Held at Petroleum Bulk Terminals – Include in item code 9500 the book value of inventories of petroleum products of your company held at bulk terminals. These inventories should be excluded from the value of inventories reported by the refineries in item code 9000.

# APPENDIX A. Report Form and Instruction Manual (M-3)—Continueu Part C – DEFINITIONS AND INSTRUCTIONS

## ▶3. Special Reporting Instructions for Shipbuilding and Repairing Industry and Aircraft and Aerospace Industries

#### a. Shipbuilding and Repairing

#### Value of Work Done (Item cade 1000)

For ships (under construction) report value of work done during the month in item code 1000. For vessels begun earlier than the month or not completed during the month, report only the value of work done during the month. Value of work done this month may be based on (a) multiplying the estimated percentage of work completed during the month by the contract price of the vessel, or (b) net billings for work done during the month, or (c) payments received for work done during this month. Please indicate in the Remarks section of this form the method chosen to report these data.

#### Inventories (Item codes 9000, 9001, 9002, 9003)

Inventories should be reported at approximate current costs, if feasible; otherwise at book values. In addition, work-in-process inventories should reflect value of work done but which has not been reported as a shipment by any of the methods listed in the paragraph above.

#### b. For Producers of Complete Aircraft and Missiles

#### Value of Shipments (Item code 1000)

Producers of these items should report the value of shipments during the month on complete aircraft, missiles, space vehicles and missile or space vehicle engines in item code 1000. This figure should reflect shipments based on delivery for work being done on a fixed price contract.

Work done on a cost-plus contract should reflect cost incurred (value of work done) during the month. Value of work done this month may be based on (a) multiplying the estimated percentage of work completed during the month by the contract price of the aircraft or missile, or (b) net billings for work done during the month, or (c) payments received for work done during the month. Please indicate in the Remarks section of this form the method chosen to report these data.

#### Inventories (Item codes 9000, 9001, 9002, 9003)

Inventories should be reported at approximate current cost, if feasible; otherwise at book value. Additionally, in order to determine the levels of raw materials, work-in-process and finished goods inventories supporting aircraft production, aircraft producers are requested to report as follows:

- Aircraft missiles, etc. produced under fixed-price contract should be reported as work-in-process inventories as the work is performed. Upon completion of the contract and/or shipment of the item, the amount of the contract or item would be deducted from work-in-process inventory account.
- For aircraft missiles, etc. produced under a cost-type contract, only relatively small values should be reported in work-in-process inventories since most of the costs incurred have been reimbursed by the customer.

#### APPENDINE Average Percentage Changes and Related Measures for Series Components

Definition of Summary Measures - The following are brief Definition of summary measures—the conoming are well definitions of the measures shown in this appendix. More complete explanations appear in Electronic Computers and Business Indicators, by Julius Shakin, issued as Occasional Paper 57 by the National Bureau of Economic Research, 1957.

Paper 57 by the National Bureau of Economic Research, 1957 (reprinted from the Journal of Business, October 1957). "O" is the average month to-month percentage change without regard to sign, in the original series." "C" is the same for the vestionally adjusted series." "I" is the same for the irregular component, which is obtained by dividing the cyclical component into the seasonally adjusted series. "C" is the same for the cyclical component which is a smooth flexible moving average of the seasonally adjusted series." "C" is the same "LENC" denotes the length of the Henderson Trend cycle. If the irregular movements are small relative to the cyclical movements, then a short moving average will be selected 9 or 13 term. If the irregular movements are large relative to the cyclical movements, than a foncer moving average will be selected 23 term.

movements, than a foncer moving average will be selected 23 term. "I C" is the average relative month to month change wighout regard to sign, of the irregular component divided by the average relative month to-month change without regard to sign, of the cyclical component. It serves as an indication of the series relative irregularity. "MCO" represents months for cyclical dominance. The werage without regard to sign percentage changes in the irregular component and cyclical component are computed for 1 month spans (January to March, February to March, etc.), up to 5 month spans. (MCO is the shorrest span for which the everage chance (without regard to sign) in the cyclical component in average change (without regard to sign) in the cyclical component is larger than the average change (without regard to sign) in the irregular component. Since changes are not computed for spans greater than 5 months, all series with an MCO greater than 5 are shown as 6. MCO is small for smooth series and large for erratic series

Sare shown as 6 MCO is small for smooth series and large for erratic surres.

"Average duration of run" is a measure of smoothness, and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, it is assumed that "no chaige" is a change in the same direction as the preceding change. The average duration of run is shown for the seasonally adjusted series CI, irregular component I, cyclical component C, and the MCD moving average with the number of terms equal to MCO of the seasonally adjusted series.

"F rest"— The standard methodology for resting whether is series demonstrates stabile seasonal fluctuation is the "F test" in essence this test compares "between months" variance of the seasonal regular ratios. (the original series divided by the trend-cycle fluctuation) against all other variance fresidual variance of the seasonal-irregular ratios. F is equal to the "between months" variance divided by the "residual" variance fifthe computer F is greater than 2.41 file I percent value for a 10-year series from a tabbed E-distribution), stable seasonality in dentifying the presence of seasonality in only one month, or in identifying seasonality in a series that undergoes moving or changing seasonal patterns. These summary measures include a statement as to whether or not the "F test" has been passed in either event, the derived seasonal factors have been used to adjust the component series. adjust the component series

### THE 1972 ECONOMIC CENSUSES

Early in 1973...we asked the business community's help in providing us with the basic information about its business activities during the year 1972. The facts were requested so that we, in turn, could provide YOU with the data from various economic areas! NOW — the results are in! They've been analyzed...fed to computers...and published for YOUR use....YOUR needs...YOUR advantage in keeping up with the latest trends in the business and industrial worlds.

There are hundreds of reports coming off the press as fast as figures are tabulated.

Get the facts! Have your name placed on our mailing lists to receive publications programs, which describe the contents of the reports and list the scheduled release dates, and publication announcements, which furnish prices and order forms for reports in print. Please fill in the request form below and mail to:

> Industry Division Milton Eisen, Chief

ACKNOWLEDGMENTS—This report was prepared under the direction of Milton Eisen, Chief of the Industry Division. John R. Wikoff, Assistant Division Chief for Current Programs provided overall guidance for this report.

Within the Industry Division, the preparation of this report as well as the monthly reports was performed under the supervision of William Menth, Chief, Shipments, Inventories, and Orders Branch, assisted by Jesse Havard and Kathleen Swindell. Other contributing industry analysts include Craig Chason, Ken Crandell, Ronald Danna, Bill Freeman, Henry Haurand, Laurie McKenna, Mattie Norwood, Pam Powell, Ruth Renwick, Clive Richmond, Steve Rudolph, and Valerie Tinker. The involvement of Audrey Brooks, David Cooper, Grace Daly, Deborah Dove, Norman Dyson, Rose Fleming, Rosella Geary, Ann Johnson, Karen Taylor, and Elizabeth Witcher is also appreciated, as is that of John Overby, who coordinated the various phases of the publication process.

The electronic computer programs were developed under the direction of Howard Hamilton, Assistant Chief for Operations, assisted by Stuart Lynn, Jerry Bell, Al Bolin, Jack Wasil and Albert Ginsberg. John Garshell, Mildred Johnson and Charles Stout were responsible for coordinating the timely processing of the monthly data.

Finally, a special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

#### NTRODUCTION

#### Summary

The monthly data in the Current Industrial Reports Series, "Manufacturers' Shipments, Inventories, and Orders," e been revised to reflect (1) benchmarking of the shipments I inventory data to the 1974, 1975, and 1976 Annual Surs of Manufactures; (2) recalculation of the new orders estites; and (3) updating of seasonal adjustment factors. The ct monthly report issued in the M3 series will be consistent h the revised data shown in this publication. The revisions this report relating to shipments and inventories and uping of the seasonal factors follow the methodology used in vious benchmarks and are discussed in detail in subsequent tions of this report.

The overall effect of the benchmarking revisions on both annual totals and on the year-to-year changes is shown table A. The magnitude of the revisions in this benchmark- are generally small. Shipments for all manufacturing instries were revised by less than 1 percent in 1974, 1975, d 1976. The figures for inventories held by manufacturers are revised downward by 0.3 percent in 1974, and upward 1.5 percent in 1975 and 1.9 percent in 1976.

# New Publication Categories

There are many industries for which data are regularly comled but not published. Except for the individual defense dustries, where publication of monthly data would frequently sclose the activities of individual companies, the usual reason r nonpublication is the relatively low proportion of the total timate accounted for by survey respondents.

During the preparation of this report, the individual series ere reviewed. As a result, estimates for several new industries ill now be included in the monthly reports. Historical data r these industries are included in this report. The newly published industries are:

C code(s)	Description	Items newly published
221	Glass containers	Shipments and total inventories <sup>1</sup>
<b>57</b>	Electronic components	Shipments, new orders, unfilled orders, and total inventories

<sup>&</sup>lt;sup>1</sup>These industries produce primarily for stock and, therefore, have no ocklog of unfilled orders.

208	Beverages	Shipments and total inventories <sup>1</sup>		
203, 204-206, 209	All other foods	Shipments and total inventories <sup>1</sup>		

In addition, new and unfilled orders data are now published for the "stone, clay and glass products" group (SIC 32) and the "instruments and related products" group (SIC 38). Previously, new and unfilled orders for these industries were included with "all other durables." With this change, "all other durables" now includes SIC 24, "lumber and wood products," SIC 25, "furniture and fixtures," and SIC 39, "other durable goods," in the shipments, new orders, unfilled orders and total inventory tables.

# II. DESCRIPTION OF THE SURVEY

The Manufacturers' Shipments, Inventories, and Orders (M3) survey provides monthly shipments and inventory figures that are comparable to the totals published in the annual survey of manufactures (ASM). The ASM is a sample survey of approximately 70,000 manufacturing establishments drawn from the 5-year census of manufactures universe of about 321,000 establishments. In the ASM, each manufacturing establishment reports data on employment, payrolls, shipments, cost of materials, capital expenditures, and inventories, as well as other selected items. Prior to 1976, the establishments did not provide information on new or unfilled orders. The collection of unfilled orders data are discussed in greater detail in section III.B.2, below.

# A. Composition of the Survey Panel

The monthly M3 estimates through 1977 are based on information obtained from approximately 5,000 reporting units and include virtually all manufacturing companies with 1,000 or more employees, as well as selected smaller companies that are included to strengthen the sample coverage in individual industry categories. For firms which operate in a single M3 industry category, the reporting unit typically comprises all operations of the company. At the request of the Census Bureau, most large, diversified companies file separate reports for divisions which operate in different industry groupings.

Each company or division of the company in the sample is classified into one of 79 industry categories for which separate estimates are made (see appendix 8) based on the major activity of the reporting unit. Some reporting units include industry activities outside the M3 industry category in which they are

assified. The survey methodology assumes that the month-toonth changes of the reporting units classified in each industry itegory effectively represent the month-to-month movements the establishments in the SIC industries which comprise is category.

The sample selected in 1962 for this survey included all impanies with more than 1,000 employees. Smaller commies were sampled proportional to their employment size. It is cause of poor response rates, reporting by companies with state than 100 employees was discontinued in 1963 and, inead, data for these companies were estimated by using overall dustry averages. In the following years, work continued on training divisional reports from large, diversified firms and on training voluntary participation of all firms with 1,000 or ore employees. This effort was intensified in the early 1970's additional funding was made available. Virtually all such impanies now report.

There was also some deterioration in response rates for comanies with between 100 and 999 employees. Therefore, in inuary 1975 a supplemental sample of approximately 1,000 impanies was selected from the universe of companies in this ze range in order to strengthen the estimates. Approximately 2 percent of the companies from this supplemental sample e now reporting, and their reports are included in the monthly stimates beginning with January 1978.

# . Monthly Estimation Procedure

The monthly estimates of shipments, unfilled orders, and otal inventories are derived for each industry category by sultiplying the industry estimate for the previous month by ne percentage change from the previous month for companies eporting in the current month.<sup>2</sup> The previous month's data for n individual firm can be either reported by the firm or "imuted" by the Census Bureau. This is a change from the proedure used prior to 1975, when reported data for both the urrent and previous month were required for a company's nclusion in the current month's estimate.

From time to time, an individual company report may show nusually large changes from the previous month which differ ubstantially from the movement shown by the rest of the reorting panel. An example of this is the effect of a strike upon n individual company. Such extreme movements are isolated rom the estimation procedure as follows: the data for the inlividual company are removed from the computation of the ggregate month-to-month percentage change and from the prior month's industry estimate; the modified percentage hange is then applied to the reduced prior month's estimate. living a current month's estimate of the entire industry excludng the company with the unusual month-to-month change; inally, the company's reported data are added to the modified surrent month's estimate to obtain the estimate for the entire ndustry. The effect of this procedure is to restrict the basis of estimation for nonrespondents and firms not in the survey anel to the general trend of the industry.

The seasonally adjusted estimates for each M3 industry category are calculated by dividing the unadjusted estimates by a seasonal adjustment factor previously computed by the X-11 seasonal adjustment program. This is discussed further in Section IV, Seasonal Adjustment.

Though collected as a separate item, new orders are not calculated according to the standard ratio-estimate procedure. The reason for this is that not all companies report new orders; and some that do report this item limit their reporting to specific products for which long lead times are required in the production cycle. These companies, in effect, exclude new orders received for products that are shipped from inventory. To take advantage of the higher response rate for shipments data and to include orders filled from inventory, new orders are computed by adjusting the current month's shipments by the change in the backlog of unfilled orders. Thus, the estimate of new orders includes orders that are recieved and filled in the same month as well as orders that have not yet been filled. Also included are the effects of cancellations and modifications of previously existing contracts.

Seasonally adjusted new orders are computed by adding the difference between the seasonally adjusted unfilled orders for the current month and previous month to the current month's seasonally adjusted shipments. This procedure preserves the definitional identity between shipments, unfilled orders, and new orders, although it will yield seasonally adjusted new orders estimates which differ slightly from an independent seasonal adjustment of new orders.

The estimation of total inventories follows the standard procedure previously described. However, because a significant number of companies that report total inventories cannot report inventories by stage of fabrication, a modified procedure is used to estimate the stage-of-fabrication data. In this procedure, the inventory totals previously estimated are cumulated to 2-digit SIC major group levels and serve as control totals for the stage-of-fabrication data. Initial estimates by stage of fabrication are made for each 2-digit SIC based on the link-relative method for reporting companies; the differences between the sum of the stage-of-fabrication detail and the total inventories are then allocated proportionally to the stage-of-fabrication figures to form the estimates. Each stage-of-fabrication estimate is adjusted by the appropriate seasonal factor to obtain seasonally adjusted figures; and, once more, the difference between the sum of the seasonally adjusted figure for inventories by stage of fabrication and the seasonally adjusted total inventories is proportionally allocated to the stage-of-fabrication detail.

#### C. Limitations of the Data

The monthly data presented in the publication are subject to both sampling and nonsampling errors. Sampling errors occur because reports are received from a sample, and not from the complete universe of manufacturing companies. Because of the present composition of the sample, the amount of sampling error cannot be quantified. Nonsampling errors, on the other hand, are attributable to many sources. The use of company or divisional reports to estimate the monthly change for establishments may be one source of nonsampling error. In addition,

<sup>&</sup>lt;sup>2</sup>This procedure is explained in greater detail in Series M3.1, Manuacturers' Shipments, Inventories, and Orders, 1947-1963 (Revised).

response and processing errors may be present, although it is believed that most of the important errors of this kind have been detected and corrected in the reasonableness and consistency review of the data prior to publication. The benchmarking of shipments and inventory data corrects systematic errors in the estimates of level for these statistics on an annual basis. Other qualification of the data, particularly for new and unfilled orders, are discussed in section III of the last benchmark report, issued in December 1976.

# III. REVISIONS TO PREVIOUSLY PUBLISHED DATA

The data included in this report revise the information previously published for the period beginning January 1974. The major reasons for revisions are discussed in detail below. In addition, as a result of the detailed review to which the data were subjected, other errors in reporting or processing were detected and corrected. These corrections have been carried to the data contained in this report.

# A. Benchmark Procedure for Shipments and Inventories

Periodically, the estimates of annual shipments and end-of-year inventories derived from the monthly survey are benchmarked to the annual totals compiled in the census and in the ASM. This benchmarking adjusts for any differences that may result from collecting monthly data on a divisional or company basis as compared to the establishment basis used in both the annual survey of manufactures and the census of manufactures. It also corrects for errors of estimation in the relatively small monthly survey and for any reporting or processing errors that may not have been detected as part of the review of the monthly estimates. The last benchmark revision was issued in December 1976 and was benchmarked to the annual data through 1973.

The benchmarking process involves comparing the monthly reports with the annual reports (form MA-100) for individual companies and reconciling large differences. Some differences are to be expected, as the monthly reports are for companies or divisions of companies, while the annual reports are for individual establishments. Corrections are made to the monthly estimates for both response and processing errors. The corrected monthly estimates are then adjusted to the annual benchmark levels for shipments and to the December year-end figures for inventories. In both processes, the original month-to-month movements are preserved to the maximum extent possible. Inventories by stage of fabrication are benchmarked in the same way and then balanced to the total inventories. For both sales and inventories, the data are extrapolated forward for the months following the benchmark year (in this case, for 1977) by using the original month-to-month movements. However, corrections are made for individual errors in the monthly movements prior to this extrapolation.

The problems encountered in measuring inventory change have been greatly exacerbated by rapid inflation and the consequent conversion by many firms to last-in-first-out (LIFO accounting. In view of this situation, an intensive review of the inventory data was initiated by the Census Bureau. A contractor independent review of this problem was awarded to the National Bureau of Economic Research (NBER). A final report on the results of the NBER research will be issued later this year. It is anticipated that the report will recommend significant changes in respondent reporting procedures designed to improve the measurement of real inventory change.

#### B. Benchmark Procedure for Unfilled Orders

#### 1. Summary of Current and Past Procedures

In the last benchmark report (December 1976), the ur filled orders figures were extensively revised. New leve were established for more than half the series utilizing th relationship of orders to shipments for 1969 and 1973. complete discussion of past procedures and revisions is in cluded in the December 1976 report.

In the present benchmarking, no systematic adjustmen have been made to the unfilled orders series other than recomputation of the seasonal factors. Individual revisior have been made in several series to reflect corrections for reporting and processing errors that became apparent in the benchmarking of shipments and inventories. In total, the backlog of orders for all manufacturing industries have bee revised upwards by 0.1 percent or \$0.1 billion.

# 2. Future Benchmarking Plans

In the discussion of unfilled orders in the December 197 report, the Bureau's plans to collect the unfilled orders in formation needed to benchmark the monthly survey est mates were described. During 1977, a survey was initiate that will produce these benchmarks for December 1976. While tabulation of the survey results is not complete at the time, the program to date can be summarized along with discussion of further plans for improving the unfilled orde series.

The major difficulty in collecting benchmark figures for unfilled orders was the recordkeeping of unfilled orders be major manufacturers. Whereas annual records of shipmen are nearly always available on a plant-by-plant basis, record of unfilled orders if maintained at all are often available on at a divisional or company level. For example, a machiner company may receive an order that may be filled by any of several plants. Generally, the assignment of the order to particular plant is not made at the time the order is received but several days later, based on the production schedules of the various plants, the urgency of the order, proximity to the customer, and so forth. On occasion, the order may not be assigned to a plant until a few days before production is a commence. Similar problems affect nearly all industries the have an unfilled orders backlog, precluding the use of a

establishment-oriented survey for collecting unfilled orders from multiestablishment companies.

As a result of this problem, the unfilled orders survey was divided into two parts. Using the 1976 Annual Survey of Manufactures (ASM) sample, each company was classified as (1) operating at a single location or (2) operating at two or more locations. The single establishment companies were asked to complete an additional question on the MA-100 form (the ASM questionnaire) relating to their backlog of unfilled orders as of December 31, 1976. Multiestablishment firms were canvassed by a separate form requesting unfilled orders by division (as defined by the firm for financial and managerial purposes). These divisional reports are being classified by industry category and will be combined with the information from single-establishment firms. Finally, these newly developed aggregates will be used in evaluation of the existing levels. Subsequent benchmarking of the entire historical series will depend on the results of this evaluation.

# /. SEASONAL ADJUSTMENT

The seasonal adjustments of the shipments, inventories, and rders were made using the X-11 variant of the Census Bureau's asonal adjustment program. This program is amply described the literature on this method.<sup>3</sup> Except as noted below, the nadjusted data from January 1958 to December 1977 were sed in the calculation of seasonal factors.

The X-11 variant of the seasonal adjustment program prodes improved techniques for the treatment of extremes and a egression program to identify trading-day adjustment to the nonthly aggregates. However, the trading-day routine is optionand has not been used for the M3 survey. Instead, data in ne individual reports are adjusted prior to tabulation for the umber of trading days as well as for any variation in the ength of the reporting period. Moreover, special techniques ave been used where the impact of a strike or other unusual courrence has not been adequately adjusted by the mechanics of the program. Special adjustments are used also during the model year change-over period in the automobile industry.

The computation of seasonal adjustment factors by the tandard X-11 program provides for the recognition of changing easonal patterns. An examination of the seasonal factors for number of series indicated that the computed trend in the easonal factors was more an oscillation within a narrow band than a true trend in the seasonal pattern. In such cases, the rend in seasonality was reduced by expanding the number of rears used in computing the moving averages for specific months, or eliminated altogether by using a stable seasonal.

Appendixes C through E provide the trading day adjustments; he monthly seasonal factors; the average monthly percentage change; and related measures for shipments, unfilled orders, and inventories. New orders are not independently seasonally adjusted but are derived from the seasonally adjusted shipments and the change in the seasonally adjusted unfilled orders.

#### A. Trading-Day Factors

Variation in the rate of activity that arises from the existence of different numbers of trading days in the same month for different years can be an important cause of month-to-month irregular fluctuations. Unlike some other causes of irregular fluctuations such as unexpected economic developments, unusual weather, and statistical errors, trading-day irregularities can be approximately identified and removed so that the underlying trend-cycle stands out more clearly. Hence, it is often possible to reduce the irregular factor by a trading-day adjustment.

Considerations used in selecting trading-day adjustment factors are knowledge concerning industry practices, tests of alternative sets of factors, and derivations of trading-day factors based upon the information contained within the data.

For most series, the development of monthly trading-day adjustment factors are based upon the assumption of equal weights for Monday through Friday, half-weight for Saturday and half-weight for Sunday. The logic for this trading-day pattern rests on the assumption that (1) the books in which sales records are kept are generally open Monday through Friday and that (2) about half of the sales volume each month takes place with monthly periodicity independent of the vagaries of the month-end calendar. In allowing for this half of the sales volume, equal treatment is given to Saturday and Sunday.

Statistical tests as part of the 1962 benchmarking operation also suggested the use of the 5, 1/2, 1/2 set of daily weights. In general, the set of trading-day factors that yields the smallest residual irregular component (1) after seasonal adjustment may be considered the best. For most series, the seasonal adjustment based upon 5, 1/2, 1/2 daily weight yielded smaller changes than other alternatives.

For the few series where the 5, 1/2, 1/2 adjustment was not appropriate, methods of deriving trading-day factors from evidence contained within the data played an important role in selecting the trading-day factors.<sup>4</sup> These series were shipments and new orders of (a) newspapers, periodicals, books; (b) pulp and paperboard mills, except building; and (c) tobacco. The selected weights for the three shipments series are given in the table below. For the shipments series, this table compares the irregular component (1) based on the selected set with 1 based on the 5, 1/2, 1/2 set and 1 from a seasonal run with no adjustment for trading days. In all cases the trading-day adjustment is modified to convert each month to one-twelfth of a year prior to seasonal adjustment. This is the same, conceptually,

<sup>&</sup>lt;sup>3</sup> Electronic Computers and Business Indicators, National Bureau of conomic Research Occasional Paper 57 (New York, 1957); Tests and Revisions of Bureau of the Census Methods of Seasonal Adjustments, Bureau of the Census Technical Paper No. 5 (Washington, 1961); The (-11 Variant of the Census Method II Seasonal Adjustment Program, Bureau of the Census Technical Paper No. 15 (Washington, 1967).

<sup>&</sup>lt;sup>4</sup> For an explanation of these methods, see "The Measurement of Calendar Variation" in *Seasonal Adjustment on Electronic Computers* (Milwood, New York, 1958), pp. 343-359.

as a daily average rate raised to a monthly level. These adjustment factors are shown in appendix C.

The use of a pattern of daily activity to construct monthly trading-day factors does not necessarily mean that the industry actually has such a pattern of daily activity. What is implied is a monthly rate of activity that varies partly with the number of Mondays, Tuesdays, etc., in the month.

#### B. Adjustments for Extremes

The routine X-11 procedure has been used to adjust for strikes in all areas except in the steel and automobile industries. In the steel industry a strike, or the anticipation of a strike, has occurred every 3 years and has altered the seasonal pattern for shipments, inventories, and orders data in these periods by creating a general pattern of heavy ordering before the strike deadline and a weak ordering rate after the contract deadline. To eliminate the effect of these irregular movements on the data, the seasonally adjusted data were developed excluding the years in which a strike either occurred or had been anticipated. After the strike years were eliminated, the remaining years were spliced together and the seasonal adjustment was then done. After seasonal adjustment, the excluded years were reintroduced, with the seasonal factors being the average for the years before and after the year excluded.

The seasonal adjustment of shipments data for automotive assembly operations presents a special problem. Each year the automotive assembly plants suspend operations to retool assembly lines for the next model year.

This results in enormous fluctuations in the July, August, and September data, which do not always occur in the same month or in the same magnitude. Seasonal adjustment, therefore, cannot be done during these months in the usual manner, and a special procedure is used. As the model changeover period always takes place entirely within the 3-month period, the problem of the timing of the changeover is removed by modifying the input data to the seasonal adjustment program. The figures for July, August, and September are replaced with the average of the 3 months and the series is seasonally adjusted.

The seasonally adjusted figures are then averaged again. Fc publication purposes, the original (unaveraged) figures are use to prepare the unadjusted data and the seasonally adjuste averaged numbers are used to prepare the seasonally adjuste data.

#### C. Defense Seasonals

Beginning in 1976, the fiscal year for the Federal Govern ment was changed from a July 1-July 30 basis to an Octobe 1-September 30 basis. This change in the Government's fisci year probably affected the awarding of contracts and othe financial arrangements. Although the impact of this change not known, the use of previously established seasonal pattern would have substantially distorted the current data since thes seasonal factors reflect historical Government purchasin patterns. Therefore, beginning in June 1976, new composit seasonal factors were developed by combining the existing en of fiscal year information with data for the previous calendal quarter (i.e., one quarter preceding the end of the fiscal year These composite factors were applied to the unfilled orders day for each of the separately tabulated defense industries. Th adjustment also modified the new orders data. Similar adjus ments could not be made for nondefense Government orde since such data are not compiled separately. This method c calculating the seasonal factors will be used until a sufficier amount of data are available to assess the impact of the chang in the fiscal year on the seasonal pattern of the defense in dustries.

#### V. DEFINITION OF TERMS

As pointed out earlier, the M3 survey is benchmarked to the annual survey of manufactures so that it brings forward for a industry group the value of shipments and inventories as tabilited annually in that establishment-based survey. The data reported monthly in the company-based reports in the M3 madiffer somewhat from those reported annually in the establishment-based reports because of differing accounting presents.

Table B. Average Month-to-Month Percent Change (Without Regard to Sign) in the Irregular Component (I) Based on Selected Trading-Day Adjustment Compared with 5, 1/2, 1/2 and No Trading-Day Adjustments

	Selected weights						ī			
Series	М	Т	w	Т	F	S	S	Selected weights	5, 1/2, 1/2 day weights	No adjust- ment
Shipments of— Newspapers, periodicals, books Pulp and paperboard mills, except building Tobacco products	1 1 2	1 1 1	1 1 1	1 1 1	1 1 1	1 1 0	1-½ ½ 0	1.59 1.10 2.32	3.18 1.30 2.95	1.8 1.2 3.8

edures used by the reporting companies. However, the linkelative procedure converts these reported monthly data coneptually to the equivalent of the annual survey of manuactures data.

#### 4. Value of Shipments

Value of shipments as reported in the ASM are received or eceivable net selling values, f.o.b. plant, after discounts and illowances and excluding freight charges and excise taxes. Where the products of an industry are customarily delivered by he manufacturing establishment (such as in certain foods infustries—fluid milk, bakery, soft drinks), the value is based on lelivered price rather than the f.o.b. plant price. In the annual urvey, multiestablishment companies report value information for each plant as if it were a separate economic unit. Thus, products transferred from one plant to another are valued at heir full economic value—i.e., in addition to the cost of production, a reasonable proportion of company overhead and profits are included.

Included in the value of shipments are not only products made in the establishments but also those made elsewhere under contract from materials owned by the establishment. Included in shipments are the value of all products sold, transferred to other plants of the same company, or shipped on consignment. Included also are receipts of establishments in the industry for contract work performed for others, resales, receipts for miscellaneous activities such as the sale of scrap and refuse; value of installation and repair work performed by employees of the plant; and value of research and development performed at the plant.

In the shipbuilding industry, the value of work done in a given year varies considerably from the value of shipments because of the long lead time between the start and completion of a large vessel. In the annual survey, therefore, the value of work done during the year is requested rather than the value of shipments. The same procedure is followed for aircraft produced on a cost-plus contract. Aircraft produced on a fixed-price contract are reported in the usual manner when the products are shipped. Where value of work done is reported in place of shipments, the inventories are normally charged to the customer as costs are incurred and are not reported by the shipyard or the aircraft producer.

The value of shipments figures developed from the annual survey of manufactures contain duplication at the all manufacturing and industry group levels since the products of some industries are used as materials by other industries within the industry group. With the exception of motor vehicles, it is not significant at the 4-digit SIC industry level. Since the M3 industry categories typically are groupings of industries, this duplication is significant for all manufacturing, durable goods and nondurable goods categories and the various market groups. The significance of the duplication within the specific M3 industry categories varies depending on their 4-digit industry composition. It is most pronounced in a few highly integrated industry areas such as primary metals and motor vehicles and parts.

For multiunit companies the M3 reports received each month typically are not establishment reports but company level reports or "divisional" level reports that encompass groups of establishments. The actual sales reported on the M3 survey are net sales and receipts from customers and exclude the duplication of interplant transfers. These reported sales are used to calculate the month-to-month changes which bring forward the establishment-based shipments for the industry category.

#### B. Inventories

End-of-month inventories are identical in definition to the end-of-year inventories in the annual survey of manufactures. In the annual survey of manufactures, respondents are asked to report inventories of individual establishments at approximate current cost if feasible; otherwise, "at book values." Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the aggregate inventories for establishments in an industry is not precise.

Inventories are reported by stage of fabrication: (a) finished goods; (b) work in process; and (c) materials, supplies, fuel, and other inventories. In using inventories by stage of fabrication at the all manufacturing and 2-digit SIC major group levels, as well as for the durable and nondurable goods sectors, it should be noted that a finished product of one industry may be a raw material for another industry at the next stage of fabrication. Insofar as the durable and nondurable goods sectors and also the 2-digit major groups contain industries with successive stages of processing, the same type of inventories may be included under different stage-of-fabrication categories in the aggregate statistics.

In some industries, there are special problems in measuring inventories by stage of fabrication. These are industries in which products are stored under controlled conditions and where products are aged such as in the tobacco, whiskey, and cheese industries. It is not clear whether such products should be treated as finished goods or as work in process. In all these industries, substantial finished goods inventories have been reported in the annual survey of manufactures. These data have been summarized in the inventory tables in a consistent manner for all the annual survey of manufactures years used as benchmarks for the M3. The inventories reported in the M3 for each type of inventory are used to bring these end-of-year inventories forward each month. Even if there are inconsistencies in the company or divisional level inventories by stage of fabrication compared to the annual survey of manufactures establishment reports, the month-to-month data which are used to determine the ratio of change are consistent within themselves.

Not all companies in the survey panel report both total inventories and inventories by stage of fabrication. Therefore, each inventory category is estimated separately based on the ratio of change reported by matched companies reporting that item. The separate estimates for finished goods, materials, and work in process are then adjusted to total inventories for each 2-digit major group.

#### C. New Orders Received and Unfilled Orders

Orders as reported in the monthly survey are net of cancellations during the month. They include orders received and filled during the period as well as orders received for future delivery. They also include the net sales value of contract changes which increase or decrease the sales value of the unfilled orders to which they relate. Orders are defined to include only those supported by binding legal documents such as signed contracts, letters of award, or letters of intent, although in some industries this definition may not be strictly applicable. In case of letters of intent, the full amount of the sales value is included if the parties are in substantial agreement on the amount; otherwise, only the funds specifically authorized to be expended are included. The respondent is instructed to deduct the sales value of partial or complete cancellation of existing orders.

Unfilled orders include orders as defined above that have not been reflected as shipments. Generally, unfilled orders at the end of the reporting period are equal to unfilled orders at the beginning of the period plus net new orders received less net shipments.

While both new orders and unfilled orders are used in reviewing individual company reports for consistency, only unfilled orders are estimated directly in the tabulated totals. New orders, as mentioned above, are derived from the shipments plus net change in unfilled orders for each industry category. This procedure is followed for seasonally adjusted data as well. Shipments and unfilled orders are seasonally adjusted independently. Seasonally adjusted new orders are derived from seasonally adjusted shipments and seasonally adjusted unfilled orders.

#### D. Industry Classification

The 75 industry categories used in the survey are groupings of 4-digit SIC industries as defined in the 1972 Standard Industrial Classification Manual as amended. The definitions are shown in appendix B.

The coverage for many of these 75 categories is not sufficient to warrent publication of the data. In addition to limitations imposed by the size of the sample, coverage is reduced for some groupings as a consequence of consolidated reporting by some multiunit companies. A company which reports on a consolidated basis (either the entire company or a division) is included only in the one M3 category in which the reporting unit as a whole is classified. Therefore, in the monthly estimates, its combined activity influences only the movement of that industry category and has no influence on the movement of the other industries included in the combined report. As a result, it has been necessary to combine these 75 industry categories into 41 groups (16 SIC 2-digit major gorups or combinations of 2-digit major groups, plus 29 additional categories) for the publication of shipments and total inventories. In presenting orders and inventories by stage of fabrication, it has been necessary to introduce further combinations because of the lower response rates for those items.

#### 1. Market Grouping Categories

In addition to presenting data for industry categories within the 2- and 3-digit SIC groups, the M3 also presents the basic data in terms of markets. These groupings are designed to (a) separate shipments of final products from shipments of semifabricated products and materials for further manufacture or for use by the construction industry, and (b) to distinguish finished goods production as to durability and between consumer-type products and equipment items. Such economic time series provide useful measures for isolating the impact of changes in demand in various sectors of the economy and greatly facilitate analysis of cyclical and growth developments. The market grouping categories provide a further division of final products between consumer goods and equipment for business and government use.

Within the consumer goods division, subtotals are provided for home goods and apparel, and for consumer staples. Materials, including supplies and intermediate products, are subdivided into construction materials and all other. For reasons to be discussed later, automotive equipment is treated as a separate market grouping. The industry composition of the market groupings is shown in appendix B.

In determining the 4-digit industry composition of the basic M3 industry categories, the desirability of aggregating data into the 2-digit and 3-digit SIC groups and into market categories was an important consideration. The extent to which separate tabulation categories could be formed had to be reconciled with the limits imposed by the sample and the reporting capabilities of multi-industry companies. Generally, industries within the same 3-digit group were treated as a unit unless there were strong indications that a separate category could be set up for a single 4-digit industry or combination of industries within the 3-digit group.

The market grouping series is very valuable in the presentation of the monthly industry survey data. However, there are certain qualifications which should be taken into consideration when using the figures. Foremost is the fact that the SIC system which is basic to the monthly survey, is an industry rather than a product classification system. For this reason, the classification system yields only approximate groupings for marketing purposes. Frequently the industry structure does not distinguish between finished goods which are sold to the consumer and the business markets, and intermediate products which are to be incorporated in final products by other industries.

With one exception, the market grouping categories permit direct comparisons to be made with Federal Reserve Board market groupings in use *prior* to 1971. The major difference in the two series is the treatment of motor vehicles and parts which is shown as a separate category in the monthly industry survey. In the Federal Reserve Board Index of Production this category is spread among three

<sup>&</sup>lt;sup>5</sup> The advantages of using market groupings in economic analysis have been described at greater length in the Federal Reserve Board publication, *Industrial Production*, 1971 Revision.

groupings. The Federal Reserve Board classifies all passenger automobiles and motor vehicle replacement parts in consumer goods, along with automobile trailers, boat building, motorcycles and bicycles. Trucks and buses are classified in equipment and motor vehicle parts for original equipment in materials. The monthly industry survey reports do not separate the value of cars and trucks and it would be most difficult to parallel the Federal Reserve Board categories in this respect. The Federal Reserve Board revised its series in 1971.

# 2. Household Durable Goods Industries

#### Capital Goods Industries

In addition to the market categories, there are two supplementary series: household durable goods industries and capital goods industries.<sup>6</sup> The capital goods industries category is further subdivided into two components: defense and nondefense. These categories are useful in bringing together industries that are subjected to the influence of distinct economic forces and exhibit unique patterns in shipments, inventories, and orders. Seasonal factors are presently developed directly from the historical data of the separate defense and nondefuse portion of the ordnance, communication equipment, complete aircraft, aircraft parts, and shipbuilding industries. The separation of each industry into defense and nondefense components from January 1968 forward in no way compromises the historical comparability of the total industry without seasonal adjustment. However, the data user should be cautioned that the comparability of the seasonally adjusted series demonstrates a potential break, particularly in the year 1968, due to the separate seasonal adjustment of defense and nondefense components of each industry.

<sup>&</sup>lt;sup>6</sup> Household durable goods industries—Household furniture; kitchen icles and pottery; cutlery, handtools and hardware; household applices; ophthalmic goods, watches, clocks, and watch cases; and mislaneous personal goods.

<sup>&</sup>lt;sup>7</sup> Capital Goods Industries:

Nondefense products—Machinery; except electrical (excluding farm machinery and equipment and machine shops), electrical machinery (excluding household appliances, radio and TV, and electronic components), and the nondefense portions of shipbuilding and military tank vehicles, railroad equipment, communication equipment, aircraft and aircraft parts, and ordnance.

Defense—Shipbuilding and military tank vehicles, communication equipment, aircraft, aircraft parts, and ordnance.

All Manufacturing Industries — Manufacturers' Shipments, New Orders, and Unfilled Orders — Seasonally Adjusted: 1967-1977

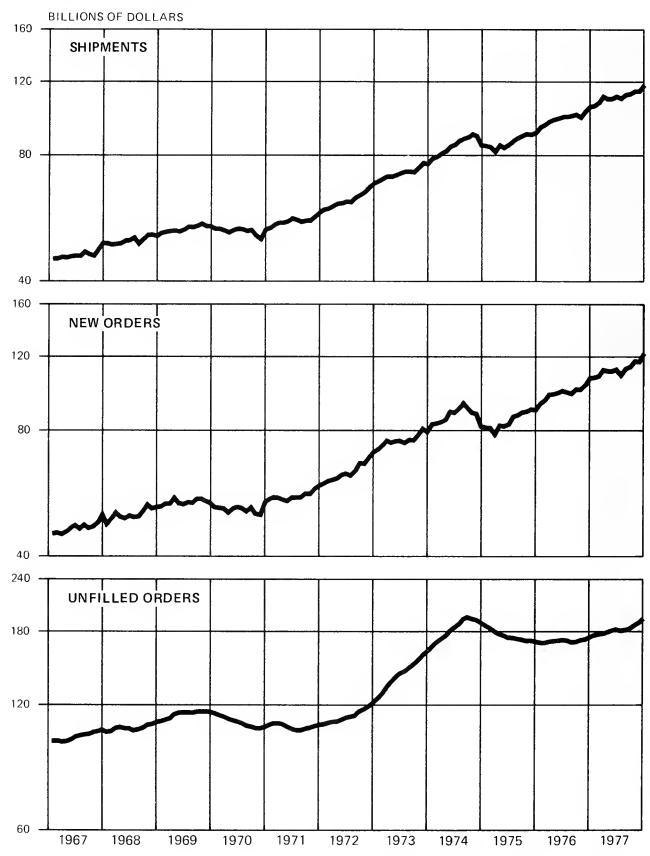

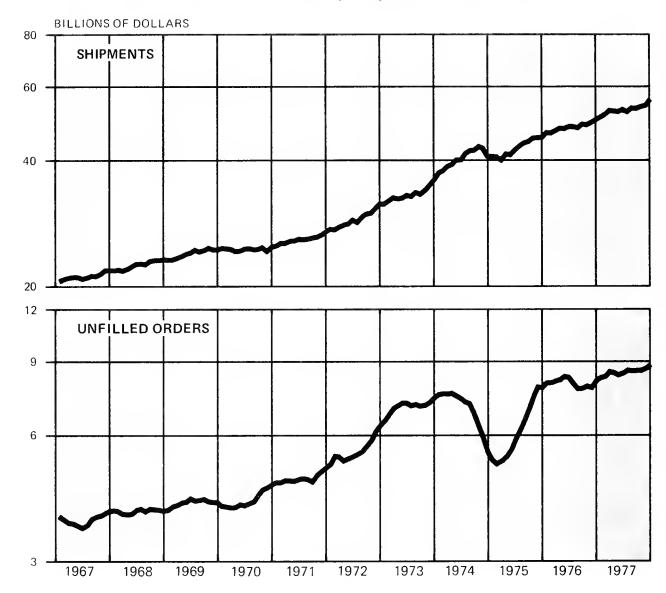

CHART B.

Durable Goods Industries — Manufacturers' Shipments, New
Orders, and Unfilled Orders — Seasonally Adjusted: 1967-1977

CHART C.

Nondurable Goods Industries — Manufacturers' Shipments and Unfilled Orders — Seasonally Adjusted: 1967-1977

All Manufacturing, Durable Goods, and Nondurable Goods Industries — Manufacturers' Inventories — Seasonally Adjusted: 1967-1977

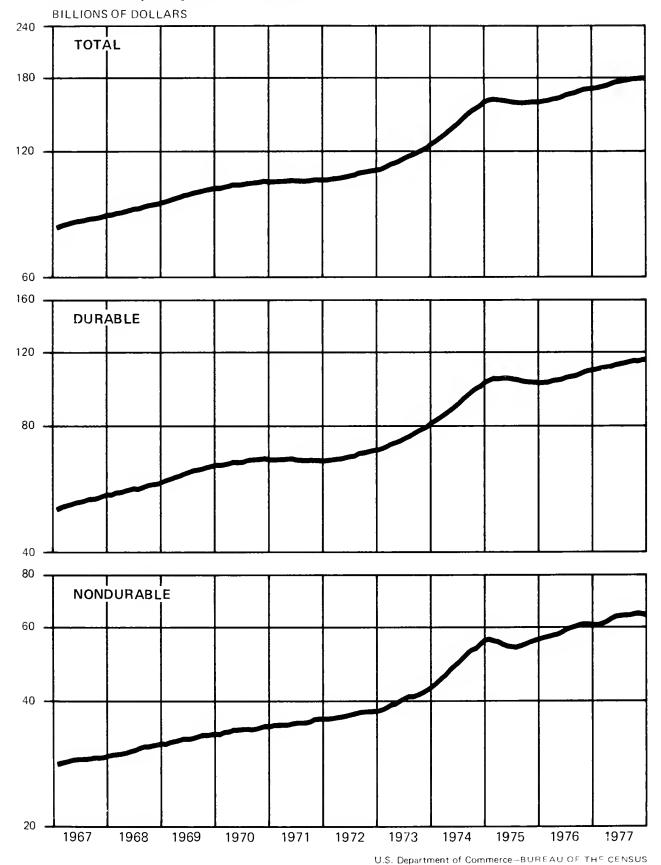

Table 1. Manufacturers' Shipments, New Orders, Unfilled Orders, and Inventories, Without Seasonal Adjustment, 1958 to 1977

(Millions of dollars)

	Shipments	New orders	Unfilled	inventories (end of year)						
Year	,		orders	Total	Materials and	Work in process	Finished goods			
	(monthly average)	(monthly average)	(end of year)		supplies	work in process	Tillianed goods
